The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection. A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the plastic nut cap snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

### REMOVAL

(1) Carefully pry the plastic nut cap off of the nut on the rear wiper motor output shaft end of the wiper arm (Fig. 9).

(2) Remove the nut that secures the rear wiper arm to the rear wiper motor output shaft.

(3) Lift the rear wiper arm far enough to engage the over-center arm hinge in its upright position to hold the wiper blade off of the liftgate.

(4) If necessary, use a battery terminal puller to disengage the wiper arm from the rear wiper motor output shaft splines (Fig. 10).

(5) Remove the rear wiper arm pivot end from the motor output shaft.

- 2 - WIPER PIVOT SHAFT
- 3 - BATTERY TERMINAL PULLER

## INSTALLATION

**NOTE:** Always install the wiper arm and blade with the wiper motor in the Park position.

(1) The rear wiper arm must be indexed to the motor output shaft with the rear wiper motor in the park position to be properly installed. Place the wiper arm onto the liftgate with the wiper arm support positioned on the park ramp and the tapered mounting hole on the pivot end of the arm positioned over the rear wiper motor output shaft.

(2) Position the tab on the back of the rear wiper arm support on the liftgate park ramp in the Installation Position (Fig. 11).

- 2 - PARK RAMP
- 3 - REAR WIPER ARM
- 4 - INSTALLATION POSITION
- 5 - REAR WIPER ARM AND BLADE
- 6 - PARK POSITION
- 7 - PARK RAMP
- 8 - LIFTGATE

(3) With the wiper arm in the Installation Position, push the tapered mounting hole on the pivot end of the wiper arm down over the rear wiper motor output shaft.

(4) Install and tighten the nut that secures the rear wiper arm to the rear wiper motor output shaft. Tighten the nut to 18 N·m (13 ft. lbs.).

(5) Reinstall the plastic nut cap over the nut on the rear wiper motor output shaft end of the rear wiper arm.

(6) Lift the rear wiper arm support away from the park ramp, then place the wiper arm support in the park ramp in the Park Position (Fig. 11).

## REAR WIPER BLADE

### DESCRIPTION

**Fig. 12 Rear Wiper Blade - Typical**

- 1 - SUPERSTRUCTURE
- 2 - PIVOT PIN
- 3 - LATCH RELEASE
- 4 - PIVOT BLOCK
- 5 - CLAW
- 6 - FLEXOR
- 7 - ELEMENT

The rear wiper blade is secured by an integral latching pivot block to the hook formation on the tip of the rear wiper arm, and rests off the glass on a park ramp on the liftgate near the base of the liftgate flip-up glass opening when the wiper is not in operation (Fig. 12). The rear wiper blade consists of the following components:

- **Superstructure** - The superstructure includes a stamped steel bridge and plastic links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

- **Element** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.

- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All Grand Cherokee models have a single 31.00 centimeter (12.20 inch) rear wiper blade with a non-replaceable rubber element (squeegee). The wiper blade cannot be adjusted or repaired. If faulty, worn, or damaged the entire wiper blade unit must be replaced.

### OPERATION

The rear wiper blade is moved back and forth across the glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

### REMOVAL

**NOTE:** The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the rear wiper motor output shaft.

(1) Disengage the rear wiper arm support from the rubber rear wiper arm park ramp on the right side of the liftgate just below the liftgate flip-up glass.

(2) Lift the rear wiper arm to engage the arm hinge in its over-center position with the wiper blade and element off of the liftgate and the glass.

(3) To remove the wiper blade from the wiper arm, push the pivot block latch release tab under the tip of the arm and slide the blade away from the tip towards the rear wiper motor output shaft end of the arm (Fig. 13).

**Fig. 13 Wiper Blade Remove/Install - Typical**

- 1 - PIVOT BLOCK LATCH RELEASE TAB

## REAR WIPER BLADE (Continued)

(4) Slide the rear wiper blade away from the tip of the arm towards the pivot end of the arm far enough to disengage the pivot block from the hook formation on the end of the arm.

(5) Extract the hook formation on the tip of the wiper arm from the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit.

**CAUTION:** Do not allow the wiper arm to spring back against the liftgate or the glass without the wiper blade in place or they may be damaged.

(6) Gently lower the wiper arm and place the arm support in the park ramp.

## INSTALLATION

**NOTE:** The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the rear wiper motor output shaft.

(1) Lift the rear wiper arm off of the liftgate park ramp.

(2) Position the rear wiper blade near the hook formation on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the rear wiper motor output shaft.

(3) Insert the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit far enough to engage the pivot block with the hook (Fig. 13).

(4) Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the latch release tab snaps into its locked position.

(5) Gently lower the wiper arm and place the arm support on the park ramp.

## REAR WIPER MODULE

### DESCRIPTION

The rear wiper module is concealed within the liftgate, below the liftgate flip-up glass and behind the liftgate inner trim panel (Fig. 14). The end of the motor output shaft that protrudes through the liftgate outer panel to drive the rear wiper arm and blade is the only visible component of the rear wiper module. A rubber gasket, a bezel, and a nut secure and seal the motor output shaft to the liftgate outer panel. A molded plastic nut cover snaps onto the bezel to conceal the nut and improve appearance. An integral connector receptacle connects the rear wiper module to the vehicle electrical system through a

80ba781c

**Fig. 14 Rear Wiper Module**

- 1 - KEYED SLOTS
- 2 - LIFTGATE WIRE HARNESS CONNECTOR
- 3 - REAR WIPER MODULE
- 4 - NUT (2)
- 5 - LIFTGATE INNER PANEL

dedicated take out and connector of the liftgate wire harness. The rear wiper module consists of the following major components:

- **Bracket** - The rear wiper module bracket consists of a stamped steel mounting plate for the wiper motor that is secured with screws through two rubber insulators to the liftgate inner panel.

- **Electronic Controls** - The rear wiper module electronic controls include the rear wiper system electronic logic and rear wiper motor electronic controls. The electronic controls for the motor include an electronic speed control that speeds the wiper blade near the center of the glass, but slows the wiper blade during directional reversals at each end of the wipe pattern and during wiper blade off-the-glass parking for quieter operation.

- **Motor** - The permanent magnet rear wiper motor is secured with screws to the rear wiper module bracket. The wiper motor includes an integral transmission, and the motor output shaft.

The rear wiper module cannot be adjusted or repaired. If any component of the module is faulty or damaged, the entire rear wiper module unit must be replaced. The motor output shaft gasket, bezel, nut, and nut cover are available for individual service replacement.

### OPERATION

The rear wiper module receives non-switched battery current through a fuse in the Junction Block (JB) on a fused B(+) circuit and is connected to ground at all times. The rear wiper module operation

## REAR WIPER MODULE (Continued)

is controlled by the vehicle operator through battery current signal inputs received by the rear wiper module electronic controls from the rear wiper switch circuitry of the right (wiper) multi-function switch on the steering column. The module also receives an external control input from the liftgate flip-up glass ajar switch circuit. If the rear wiper module senses that the flip-up glass is ajar, it will not allow the rear wiper motor to operate.

The rear wiper module electronic control logic uses these inputs, its internal inputs, and its programming to provide a continuous wipe mode, an intermittent wipe mode, a wipe-after-wash mode, and off-the-glass wiper blade parking. The wiper blade cycling is controlled by the internal electronic controls of the module. The module controls current flow to the wiper motor brushes and provides an electronic speed control that speeds the wiper blade near the center of the glass, but slows the wiper blade during directional reversals at each end of the wipe pattern and during wiper blade off-the-glass parking for quieter operation.

The wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the liftgate flip-up glass. The rear wiper module may be diagnosed using conventional diagnostic tools and methods.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the rear wiper arm from the rear wiper motor output shaft. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS/REAR WIPER ARM - REMOVAL).

(3) Using door trim panel removal tool, gently pry at the base of the nut cover where it meets the wiper motor output shaft bezel and gasket on the outer liftgate panel to unsnap it from the bezel (Fig. 15). **Be certain to take proper precautions to protect the outer liftgate panel and its paint finish from damage during this procedure.**

(4) Remove the nut that secures the rear wiper motor output shaft to the outer liftgate panel.

(5) Remove the bezel and gasket from the rear wiper motor output shaft.

(6) Remove the trim panel from the liftgate inner panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILOUT/TRIM PANEL - REMOVAL).

(7) Disconnect the liftgate wire harness connector for the rear wiper module from the module connector receptacle (Fig. 16).

(8) Loosen the two nuts that secure the rear wiper module mounting bracket to the top of the lower flip-up glass opening of the liftgate inner panel.

- 1 - KEYED SLOTS
- 2 - LIFTGATE WIRE HARNESS CONNECTOR
- 3 - REAR WIPER MODULE
- 4 - NUT (2)
- 5 - LIFTGATE INNER PANEL

(9) Slide the rear wiper module and mounting bracket forward far enough to disengage the mounting nuts from the keyed slots in the top of the lower flip-up glass opening of the liftgate inner panel.

(10) Remove the rear wiper module and mounting bracket from the liftgate as a unit.

## REAR WIPER MODULE (Continued)

**INSTALLATION**

(1) Position the rear wiper module and bracket into the liftgate as a unit (Fig. 16).

(2) Insert the rear wiper motor output shaft through the hole in the liftgate outer panel and engage the two mounting nuts into the keyed slots in the top of the lower flip-up glass opening of the liftgate inner panel.

(3) From the outside of the liftgate, center the rear wiper motor output shaft in the liftgate outer panel clearance hole and install the gasket and bezel over the centered shaft (Fig. 15).

(4) Install and tighten the nut that secures the rear wiper motor output shaft to the outer liftgate panel. Tighten the nut to 5 N·m (43 in. lbs.).

(5) From the inside of the liftgate, install and tighten the two nuts that secure the rear wiper module mounting bracket to the top of the lower flip-up glass opening of the liftgate inner panel. Tighten the nuts to 5 N·m (47 in. lbs.).

(6) Reconnect the liftgate wire harness connector for the rear wiper module to the module connector receptacle.

(7) Reinstall the trim panel onto the liftgate inner panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

(8) From the outside of the liftgate, press the nut cover firmly and evenly over the rear wiper motor output shaft bezel using hand pressure until it snaps into place.

(9) Reinstall the rear wiper arm onto the rear wiper motor output shaft. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS/REAR WIPER ARM - INSTALLATION).

(10) Reconnect the battery negative cable.

**WIPER ARM PARK RAMP****REMOVAL**

(1) Disengage the rear wiper arm support from the wiper arm park ramp on the right side of the liftgate just below the liftgate flip-up glass.

(2) Lift the wiper arm and blade away from the liftgate until the wiper arm hinge is in its over-center position.

(3) Remove the screw that secures the wiper arm park ramp to the liftgate outer panel (Fig. 17).

**Fig. 17 Wiper Arm Park Ramp Remove/Install**

- 1 - RIVET NUT
- 2 - SCREW
- 3 - PARK RAMP
- 4 - LIFTGATE

(4) Remove the wiper arm park ramp from the liftgate outer panel.

**INSTALLATION**

(1) Position the wiper arm park ramp onto the liftgate outer panel (Fig. 17).

(2) Install and tighten the screw that secures the wiper arm park ramp to the liftgate outer panel. Tighten the screw to 7 N·m (60 in. lbs.).

(3) Lower the rear wiper arm and blade and place the wiper arm support onto the wiper arm park ramp.

WIRING DIAGRAM  
INFORMATION

## DESCRIPTION

DESCRIPTION - HOW TO USE WIRING  
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicle wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

## SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

## WIRING DIAGRAM INFORMATION (Continued)

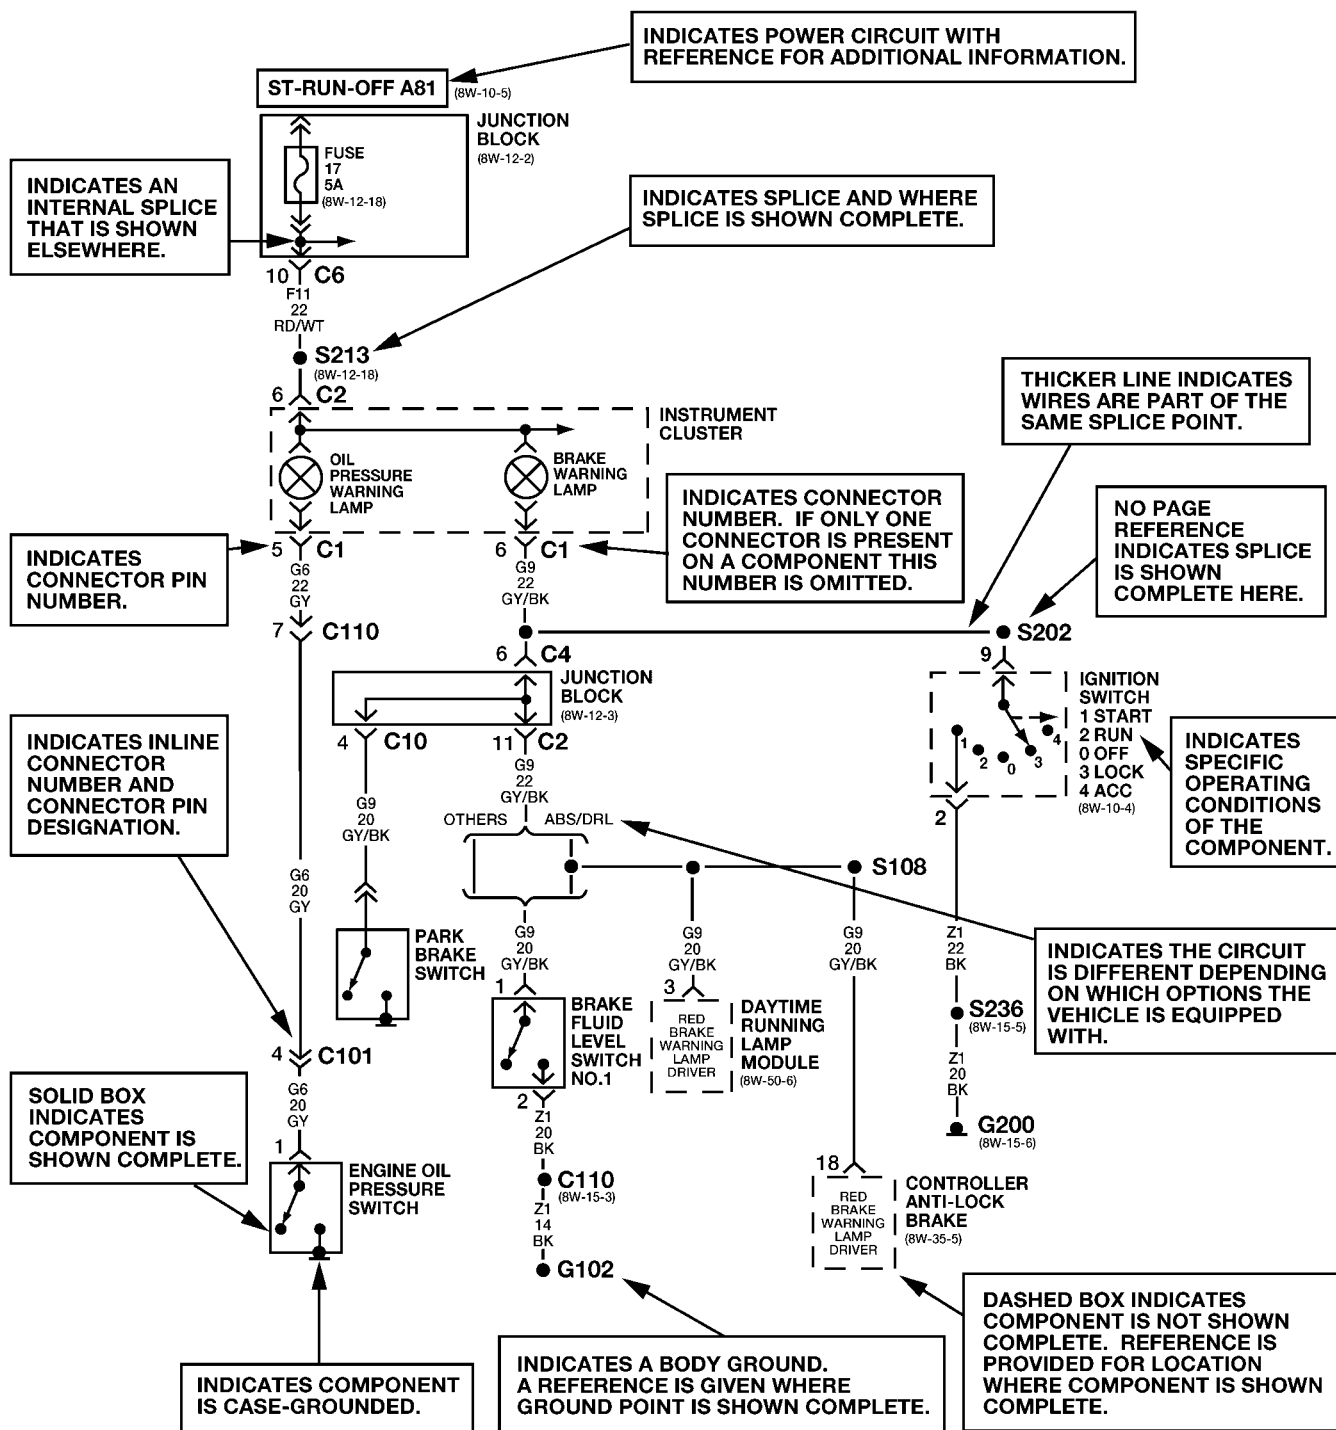

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

Fig. 1 WIRING DIAGRAM EXAMPLE 1

## WIRING DIAGRAM INFORMATION (Continued)

**DESCRIPTION - CIRCUIT FUNCTIONS**

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

*CIRCUIT IDENTIFICATION CODE CHART*

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS

V	SPEED CONTROL, WIPER/WASHER
W	OPEN
X	AUDIO SYSTEMS
Y	OPEN
Z	GROUND

**DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION**

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

*WIRING SECTION CHART*

GROUP	TOPIC
8W-01 thru 8W-09	General information and Diagram Overview
8W-10 thru 8W-19	Main Sources of Power and Vehicle Grounding
8W-20 thru 8W-29	Starting and Charging
8W-30 thru 8W-39	Powertrain/Drivetrain Systems
8W-40 thru 8W-49	Body Electrical items and A/C
8W-50 thru 8W-59	Exterior Lighting, Wipers and Trailer Tow
8W-60 thru 8W-69	Power Accessories
8W-70	Splice Information
8W-80	Connector Pin Outs
8W-91	Connector, Ground and Splice Locations

## WIRING DIAGRAM INFORMATION (Continued)

**DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION**

**CAUTION:** Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

**IDENTIFICATION**

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.
- Splices are identified with an "S" and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

**LOCATIONS**

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

**WARNING****WARNINGS - GENERAL**

**WARNINGS** provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

**WARNING: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.**

**WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.**

**WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.**

**WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.**

**WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.**

**WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.**

**WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.**

**WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.**

**WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.**

**DIAGNOSIS AND TESTING - WIRING HARNESS****TROUBLESHOOTING TOOLS**

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

**WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.**

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

**CAUTION:** Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

## WIRING DIAGRAM INFORMATION (Continued)

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

**CAUTION:** Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

- Probing Tools - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

**Fig. 5 PROBING TOOL**

948W-233

- 1 - SPECIAL TOOL 6801  
2 - PROBING END

### INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

### TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-

factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.
- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
- (4) Isolate the problem area.
- (5) Repair the problem area.
- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

## STANDARD PROCEDURE

### STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

- (1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
- (2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.
- (3) When using a voltmeter, be sure to connect the ground lead first.
- (4) Do not remove the part from its protective packing until it is time to install the part.
- (5) Before removing the part from its package, ground the package to a known good ground on the vehicle.

**Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL**

80ce3d47

## WIRING DIAGRAM INFORMATION (Continued)

**STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL**

(1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).

(2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

**Fig. 7 TESTING FOR VOLTAGE POTENTIAL**

**STANDARD PROCEDURE - TESTING FOR CONTINUITY**

(1) Remove the fuse for the circuit being checked or, disconnect the battery.

(2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).

(3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

**Fig. 8 TESTING FOR CONTINUITY**

1 - FUSE REMOVED FROM CIRCUIT

**STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND**

(1) Remove the fuse and disconnect all items involved with the fuse.

(2) Connect a test light or a voltmeter across the terminals of the fuse.

(3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.

(4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

## WIRING DIAGRAM INFORMATION (Continued)

**STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS**

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.
- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

**STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP**

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).
- (2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

## CONNECTOR

### REMOVAL

- (1) Disconnect battery.
- (2) Release Connector Lock (Fig. 10).
- (3) Disconnect the connector being repaired from its mating half/component.
- (4) Remove the dress cover (if applicable) (Fig. 10).
- (5) Release the Secondary Terminal Lock, if required (Fig. 11).
- (6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

### INSTALLATION

- (1) Insert the removed terminal in the same cavity on the repair connector.
- (2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
- (3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.

80c97bac

**Fig. 10 REMOVAL OF DRESS COVER**

- 1 - DRESS COVER
- 2 - CONNECTOR LOCK
- 3 - CONNECTOR

- (4) Replace dress cover (if applicable).
- (5) Connect connector to its mating half/component.
- (6) Connect battery and test all affected systems.

## DIODE

### REMOVAL

- (1) Disconnect the battery.
- (2) Locate the diode in the harness, and remove the protective covering.
- (3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

948W-197

**Fig. 13 DIODE IDENTIFICATION**

- 1 - CURRENT FLOW  
 2 - BAND AROUND DIODE INDICATES CURRENT FLOW  
 3 - DIODE AS SHOWN IN THE DIAGRAMS

### INSTALLATION

- (1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.
- (2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).
- (3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
- (4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
- (5) Re-connect the battery and test affected systems.

## TERMINAL

### REMOVAL

- (1) Follow steps for removing terminals described in the connector removal section.
- (2) Cut the wire 6 inches from the back of the connector.

### INSTALLATION

- (1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness (see wire splicing procedure).
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

## WIRE

### STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

**Fig. 14 SPLICE BAND**

1 - SPLICE BAND

(4) Using crimping tool, Mopar p/n 05019912AA, crimp the splice clip and wires together (Fig. 15).

**Fig. 15 CRIMPING TOOL**

1 - CRIMPING TOOL

(5) Solder the connection together using rosin core type solder only (Fig. 16).

**CAUTION: DO NOT USE ACID CORE SOLDER.**

**Fig. 16 SOLDER SPLICE**

1 - SOLDER  
2 - SPLICE BAND  
3 - SOLDERING IRON

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 17).

Headlamp Leveling Switch . . . . .	8W-15-15
Hood Ajar Switch . . . . .	8W-15-6, 7
Horn No. 1 . . . . .	8W-15-9, 10, 11
Horn No. 2 . . . . .	8W-15-9, 10, 11
Hydraulic Cooling Module . . . . .	8W-15-9, 10, 11
Ignition Switch . . . . .	8W-15-15
Instrument Cluster . . . . .	8W-15-13, 14
Intake Port Swirl Actuator . . . . .	8W-15-3
Intrusion Transceiver Module . . . . .	8W-15-21, 22
Junction Block . . . . .	8W-15-12, 13, 15
Left Fog Lamp . . . . .	8W-15-6, 7
Left Front Park Lamp . . . . .	8W-15-5
Left Front Park/Turn Signal Lamp . . . . .	8W-15-5
Left Front Turn Signal Lamp . . . . .	8W-15-5
Left Headlamp Leveling Motor . . . . .	8W-15-5
Left High Beam Headlamp . . . . .	8W-15-5

<b>Component</b>	<b>Page</b>
Left Liftgate Ajar Switch . . . . .	8W-15-10
Left Low Beam Headlamp . . . . .	8W-15-5
Left Multi-Function Switch . . . . .	8W-15-15
Left Rear Door Lock Motor/Ajar Switch . . . . .	8W-15-21, 22
Left Rear Lamp Assembly . . . . .	8W-15-19
Left Side Repeater Lamp . . . . .	8W-15-6, 7
License Lamp No. 1 . . . . .	8W-15-20
License Lamp No. 2 . . . . .	8W-15-20
Liftgate Flip-Up Ajar Switch . . . . .	8W-15-20
Liftgate Flip-Up Release Solenoid . . . . .	8W-15-20
Line Pressure Sensor . . . . .	8W-15-2
Low Beam/Daytime Running Lamp Relay . . . . .	8W-15-12
Manual Temperature Control . . . . .	8W-15-13, 15
Oxygen Sensor 1/2 Downstream . . . . .	8W-15-4
Oxygen Sensor 2/2 Downstream . . . . .	8W-15-4
Park Lamp Relay . . . . .	8W-15-12
Passenger Door Lock Motor/Ajar Switch . . . . .	8W-15-16
Passenger Door Module . . . . .	8W-15-16
Passenger Heated Seat Switch . . . . .	8W-15-14
Passenger Lumbar Switch . . . . .	8W-15-17, 22
Passenger Power Seat Switch . . . . .	8W-15-17, 22
Passenger Rear Power Window Switch . . . . .	8W-15-16, 22
Power Amplifier . . . . .	8W-15-17, 18
Powertrain Control Module . . . . .	8W-15-2
Radiator Fan Motor . . . . .	8W-15-9, 10
Radio . . . . .	8W-15-17, 18
Rain Sensor . . . . .	8W-15-21, 22
Rear Power Outlet . . . . .	8W-15-17, 18
Rear Washer Pump . . . . .	8W-15-6, 7
Rear Window Defogger . . . . .	8W-15-20
Rear Wiper Motor . . . . .	8W-15-20
Remote Keyless Module . . . . .	8W-15-16
Right Fog Lamp . . . . .	8W-15-9, 10, 11
Right Front Park Lamp . . . . .	8W-15-8
Right Front Park/Turn Signal Lamp . . . . .	8W-15-8
Right Front Turn Signal Lamp . . . . .	8W-15-8
Right Headlamp Leveling Motor . . . . .	8W-15-8
Right High Beam Headlamp . . . . .	8W-15-8
Right Liftgate Ajar Switch . . . . .	8W-15-20
Right Low Beam Headlamp . . . . .	8W-15-8
Right Rear Door Lock Motor/Ajar Switch . . . . .	8W-15-16, 18
Right Rear Lamp Assembly . . . . .	8W-15-17, 18
Right Side Repeater Lamp . . . . .	8W-15-9, 10, 11
Seat Module . . . . .	8W-15-18, 21
Sentry Key Immobilizer Module . . . . .	8W-15-13
Shifter Assembly . . . . .	8W-15-14, 15
Siren . . . . .	8W-15-6, 7
Sunroof Control Module . . . . .	8W-15-19
Sunroof Motor . . . . .	8W-15-19
Sunroof Switch . . . . .	8W-15-19
Temperature Valve Actuator . . . . .	8W-15-13
Trailer Tow Connector . . . . .	8W-15-19
Transmission Control Module . . . . .	8W-15-2
Transmission Control Relay . . . . .	8W-15-9, 10
Vehicle Information Center . . . . .	8W-15-21, 22
Viscous/Cabin Heater . . . . .	8W-15-4
Washer Fluid Level Switch . . . . .	8W-15-6, 7

Junction Block C5 . . . . .	8W-80-94
Knock Sensor . . . . .	8W-80-94
Leak Detection Pump (Except Export) . . . . .	8W-80-94
Left Courtesy Lamp . . . . .	8W-80-95
Left Door Handle Courtesy Lamp . . . . .	8W-80-95
Left Fog Lamp . . . . .	8W-80-95
Left Front Door Speaker . . . . .	8W-80-95
Left Front Impact Sensor . . . . .	8W-80-96
Left Front Park Lamp . . . . .	8W-80-96
Left Front Park/Turn Signal Lamp (Except Export) . . . . .	8W-80-96
Left Front Side Marker Lamp (Except Export) . . . . .	8W-80-96
Left Front Turn Signal Lamp (Export) . . . . .	8W-80-97
Left Front Wheel Speed Sensor . . . . .	8W-80-97
Left Headlamp Leveling Motor (Export) . . . . .	8W-80-97
Left High Beam Headlamp . . . . .	8W-80-97
Left Instrument Panel Speaker . . . . .	8W-80-98
Left Liftgate Ajar Switch . . . . .	8W-80-98
Left Low Beam Headlamp . . . . .	8W-80-98
Left Multi-Function Switch . . . . .	8W-80-98
Left Rear Door Lock Motor/Ajar Switch . . . . .	8W-80-99
Left Rear Door Speaker . . . . .	8W-80-99
Left Rear Lamp Assembly . . . . .	8W-80-99
Left Rear Wheel Speed Sensor . . . . .	8W-80-99
Left Remote Radio Switch . . . . .	8W-80-100
Left Side Repeater Lamp (Export) . . . . .	8W-80-100
Left Visor/Vanity Lamp . . . . .	8W-80-100
License Lamp No. 1 . . . . .	8W-80-100
License Lamp No. 2 . . . . .	8W-80-101
Liftgate Flip-Up Ajar Switch . . . . .	8W-80-101
Liftgate Flip-Up Push Button Switch . . . . .	8W-80-101
Liftgate Flip-Up Release Solenoid . . . . .	8W-80-101

<b>Component</b>	<b>Page</b>
Liftgate Power Lock Motor . . . . .	8W-80-102
Line Pressure Sensor (4.7L) . . . . .	8W-80-102
Manifold Absolute Pressure Sensor (4.0L) . . . . .	8W-80-102
Manifold Absolute Pressure Sensor (4.7L) . . . . .	8W-80-102
Manual Temperature Control C1 (MTC) . . . . .	8W-80-103
Manual Temperature Control C2 (MTC) . . . . .	8W-80-103
Mass Air Flow Sensor (Diesel) . . . . .	8W-80-103
Mode Door Motor/Actuator (AZC) . . . . .	8W-80-103
Output Speed Sensor (4.0L) . . . . .	8W-80-104
Output Speed Sensor (4.7L) . . . . .	8W-80-104
Overhead Map/Courtesy Lamp . . . . .	8W-80-104
Oxygen Sensor 1/1 Upstream . . . . .	8W-80-104
Oxygen Sensor 1/2 Downstream . . . . .	8W-80-105
Oxygen Sensor 2/1 Upstream . . . . .	8W-80-105
Oxygen Sensor 2/2 Downstream . . . . .	8W-80-105
Park/Neutral Position Switch (4.0L) . . . . .	8W-80-105
Passenger Airbag . . . . .	8W-80-106
Passenger Blend Door Motor/Actuator (LHD AZC) . . . . .	8W-80-106
Passenger Blend Door Motor/Actuator (RHD AZC) . . . . .	8W-80-106
Passenger Curtain Airbag Squib . . . . .	8W-80-106
Passenger Door Lock Motor/Ajar Switch . . . . .	8W-80-107
Passenger Door Module C1 . . . . .	8W-80-107
Passenger Door Module C2 . . . . .	8W-80-107
Passenger Front Door Courtesy Lamp . . . . .	8W-80-108
Passenger Front Power Window Motor . . . . .	8W-80-108
Passenger Heated Seat Back (Premium I/ III) . . . . .	8W-80-108
Passenger Heated Seat Cushion (Premium I/III) . . . . .	8W-80-108
Passenger Heated Seat Switch . . . . .	8W-80-109
Passenger Lumbar Motor (Midline/ Premium) . . . . .	8W-80-109
Passenger Lumbar Switch (Midline/ Premium) . . . . .	8W-80-109
Passenger Power Mirror . . . . .	8W-80-109
Passenger Power Seat Front Riser Motor . . . . .	8W-80-110
Passenger Power Seat Horizontal Motor . . . . .	8W-80-110
Passenger Power Seat Rear Riser Motor . . . . .	8W-80-110
Passenger Power Seat Recliner Motor (Midline/ Premium) . . . . .	8W-80-110
Passenger Power Seat Switch (Except Midline/ Premium) . . . . .	8W-80-111
Passenger Power Seat Switch (Midline/ Premium) . . . . .	8W-80-111
Passenger Rear Power Window Motor . . . . .	8W-80-111
Passenger Rear Power Window Switch . . . . .	8W-80-111
Passenger Seat Belt Tensioner (RHD Export) . . . . .	8W-80-112
Passenger Side Impact Sensor . . . . .	8W-80-112

<b>Component</b>	<b>Page</b>
Power Amplifier C1 (Premium Radio) . . .	8W-80-112
Power Amplifier C2 (Premium Radio) . . .	8W-80-113
Powertrain Control Module C1 (Gas) . . .	8W-80-113
Powertrain Control Module C2 (Gas) . . .	8W-80-114
Powertrain Control Module C3 (Gas) . . .	8W-80-115
Radiator Fan Motor (4.0L) . . . . .	8W-80-116
Radio C1 . . . . .	8W-80-116
Radio C2 . . . . .	8W-80-116
Rain Sensor (Autowipe) . . . . .	8W-80-117

<b>Component</b>	<b>Page</b>
Right Visor/Vanity Lamp . . . . .	8W-80-123
Seat Module C1 (Premium/Heated Seats) . . . . .	8W-80-124
Seat Module C2 (Premium/Heated Seats) . . . . .	8W-80-124
Sentry Key Immobilizer Module . . . . .	8W-80-125
Shifter Assembly (Gas) . . . . .	8W-80-125
Shifter Assembly C1 (Diesel) . . . . .	8W-80-125
Shifter Assembly C2 (Diesel) . . . . .	8W-80-125
Siren (Export) . . . . .	8W-80-126
Speed Control Switch No. 1 . . . . .	8W-80-126
Speed Control Switch No. 2 . . . . .	8W-80-126
Sunroof Control Module . . . . .	8W-80-126
Sunroof Motor C1 . . . . .	8W-80-127
Sunroof Motor C2 . . . . .	8W-80-127
Sunroof Switch . . . . .	8W-80-127
Temperature Valve Actuator (MTC) . . . .	8W-80-127
Throttle Position Sensor (4.0L) . . . . .	8W-80-127
Throttle Position Sensor (4.7L) . . . . .	8W-80-128
Trailer Tow Circuit Breaker . . . . .	8W-80-128
Trailer Tow Connector . . . . .	8W-80-128
Trailer Tow Left Turn Relay . . . . .	8W-80-128
Trailer Tow Right Turn Relay . . . . .	8W-80-129
Transfer Case Position Sensor (Except Export) . . . . .	8W-80-129
Transmission Control Module (4.7L) . . . .	8W-80-129
Transmission Control Module C1 (Diesel) . . . . .	8W-80-130
Transmission Control Module C2 (Diesel) . . . . .	8W-80-131
Transmission Solenoid (4.0L) . . . . .	8W-80-131
Transmission Solenoid Assembly (Diesel) . . . . .	8W-80-131
Transmission Solenoid/TRS Assembly (4.7L) . . . . .	8W-80-132
Vehicle Information Center . . . . .	8W-80-132
Viscous/Cabin Heater (Diesel) . . . . .	8W-80-132
Washer Fluid Level Switch . . . . .	8W-80-133
Wastegate Solenoid (Diesel) . . . . .	8W-80-133
Water In Fuel Sensor (Diesel) . . . . .	8W-80-133

A/C  
COMPRESSOR  
CLUTCH

A/C COMPRESSOR CLUTCH - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	C2 14DB/BK (DIESEL)	A/C COMPRESSOR CLUTCH RELAY OUTPUT
1	C2 18DB/YL (GAS)	A/C CLUTCH RELAY OUTPUT
2	Z18 18BK	GROUND

A/C PRESSURE  
TRANSDUCER

A/C PRESSURE TRANSDUCER - BLACK 4 WAY

CAV	CIRCUIT	FUNCTION
1	K4 18BK/LB	SENSOR GROUND
2	K6 18VT/WT (DIESEL)	SENSOR REFERENCE VOLTAGE B
2	K6 18VT/BK (GAS)	5 VOLT SUPPLY
3	C18 18DB	A/C PRESSURE SIGNAL
4	-	-

ACCELERATOR  
PEDAL  
POSITION  
SENSOR  
(DIESEL)

ACCELERATOR PEDAL POSITION SENSOR (DIESEL) - BLACK 10 WAY

CAV	CIRCUIT	FUNCTION
1	-	-
2	F855 18BR/YL	SENSOR REFERENCE VOLTAGE A
3	K22 14RD/DB	ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL
4	-	-
5	-	-
6	K225 18BK	ACCELERATOR PEDAL POSITION SENSOR 2 GROUND
7	K81 20DB/DG	ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL
8	K255 20WT/DG	ACCELERATOR PEDAL POSITION SENSOR 1 GROUND
9	-	-
10	Y43 20WT/VT	ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY

ADJUSTABLE  
PEDALS  
MODULE  
(EXCEPT EXPORT)

ADJUSTABLE PEDALS MODULE (EXCEPT EXPORT) - GREEN 14 WAY

CAV	CIRCUIT	FUNCTION
1	Y151 20LG/BR	ADJUSTABLE PEDALS SWITCH SENSE (FORWARD)
2	Y152 20LG/OR	ADJUSTABLE PEDALS SWITCH SENSE (REARWARD)
3	Q110 16OR/VT	ADJUSTABLE PEDALS MOTOR (FORWARD)
4	F72 16RD/YL	FUSED B(+)
5	-	-
6	Q111 16OR/GY	ADJUSTABLE PEDALS MOTOR (REARWARD)
7	Q113 20OR/DB (MEMORY)	PEDAL POSITION SENSOR FEED
8	Q112 20OR/YL (MEMORY)	PEDAL POSITION SENSOR SENSE
9	Q114 20OR/TN (MEMORY)	PEDAL POSITION SENSOR RETURN
10	Z151 16BK	GROUND
11	Z155 20BK/OR	GROUND
12	L1 18WT/BR	BACK-UP LAMP FEED
13	D25 20VT/YL	PCI BUS
14	Y153 16DB/RD	ADJUSTABLE PEDALS SWITCH FEED

ADJUSTABLE  
PEDALS  
MOTOR/SENSOR  
ASSEMBLY  
(EXCEPT EXPORT)

ADJUSTABLE PEDALS MOTOR/SENSOR ASSEMBLY (EXCEPT EXPORT) - 6 WAY

CAV	CIRCUIT	FUNCTION
1	Q113 200R/DB	PEDAL POSITION SENSOR FEED
2	Q112 200R/YL	PEDAL POSITION SENSOR SENSE
3	Q114 200R/TN	PEDAL POSITION SENSOR RETURN
4	-	-
5	Q111 160R/GY	ADJUSTABLE PEDALS MOTOR (REARWARD)
6	Q110 160R/VT	ADJUSTABLE PEDALS MOTOR (FORWARD)

ADJUSTABLE  
PEDALS  
SWITCH  
(EXCEPT EXPORT)

ADJUSTABLE PEDALS SWITCH (EXCEPT EXPORT) - WHITE 3 WAY

CAV	CIRCUIT	FUNCTION
1	Y153 20DB/RD	ADJUSTABLE PEDALS SWITCH FEED
2	Y152 20LG/OR	ADJUSTABLE PEDALS SWITCH SENSE (REARWARD)
3	Y151 20LG/BR	ADJUSTABLE PEDALS SWITCH SENSE (FORWARD)

AIRBAG  
CONTROL  
MODULE C1  
(ORC C1)

AIRBAG CONTROL MODULE C1 (ORC C1) - YELLOW 32 WAY

CAV	CIRCUIT	FUNCTION
1	R72 20LB/WT (SIDE AIRBAGS)	PASSENGER CURTAIN SQUIB 1 LINE 2
2	R74 20LB/YL (SIDE AIRBAGS)	PASSENGER CURTAIN SQUIB 1 LINE 1
3	R56 20LB/DG (RHD EXPORT)	PASSENGER SEAT BELT TENSIONER LINE 1

## 8W-91 CONNECTOR/GROUND/SPLICE LOCATION

## TABLE OF CONTENTS

page

**CONNECTOR/GROUND/SPLICE LOCATION**

DESCRIPTION ..... 1

**CONNECTOR/GROUND/SPLICE  
LOCATION****DESCRIPTION**

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided.

Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the appropriate index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

*CONNECTORS*

<b>CONNECTOR NAME/ NUMBER</b>	<b>COLOR</b>	<b>LOCATION</b>	<b>FIG.</b>
A/C Compressor Clutch	BK	At A/C Compressor	14, 18
A/C Pressure Transducer	BK	Right Front of Engine Compartment	4, 5, 6, 7
Accelerator Pedal Position Sensor (Diesel)	BK	Rear of Engine Compartment Near Fuel/Water Separator	9
Adjustable Pedals Module (Except Export)	GN	Above Drivers Control Pedals	N/S
Adjustable Pedals Motor/Sensor Assembly (Except Export)		Above Drivers Control Pedals	N/S
Adjustable Pedals Switch (Except Export)	WT	Drivers Lower Kick Panel	28
Airbag Control Module (ORC C1)	YL	Below Center Floor Console, Behind Park Brake	N/S
Airbag Control Module (ORC C2)	YL	Below Center Floor Console, Behind Park Brake	24, 25, 27, 28, 29
Ambient Temperature Sensor	BK	On Radiator Center Support	6, 7
Antenna Module (Export)	WT	Above Right Quarter Window	N/S
Automatic Day/Night Mirror	BK	In Front of Rear View Mirror	N/S
Automatic Headlamp Light Sensor/VTSS LED	BK	Near Left Instrument Panel Speaker	24, 25
Automatic Zone Control Module - C1 (AZC)	BK	Left Side of HVAC Housing	N/S
Automatic Zone Control Module - C2 (AZC)	BK	Left Side of HVAC Housing	N/S
Battery Temperature Sensor	BK	Below Battery Tray	5, 6

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Blower Motor	BK	Behind Right Hand Side of Instrument Panel	N/S
Blower Motor Controller (AZC)	BK	Behind Right Hand Side of Instrument Panel	N/S
Blower Motor Resistor Block (MTC)	BK	Behind Right Hand Side of Instrument Panel	N/S
Body Control Module - C1	GY	Lower Left Side of Instrument Panel	28, 29
Body Control Module - C2	WT	Lower Left Side of Instrument Panel	28, 29
Boost Pressure Sensor (Diesel)	BK	Top Front of Engine	9, 10
Brake Lamp Switch	DKGY	Brake Pedal Arm	38
C100	BK	Right Front Engine Compartment	3, 6
C101 (4.0L RHD)	BK	Rear of Engine Compartment	N/S
C101 (4.7L RHD)	BK	Rear of Engine Compartment	N/S
C102 (Diesel)	BK	Left Rear Engine Compartment	5, 9
C102 (Gas)	BK	Right Rear Engine Compartment	6, 16, 19, 20, 23
C103 (Diesel)	GY	Rear of Engine	5, 9
C103 (Gas)	GY	Right Rear Engine Compartment	6, 15, 16, 19, 20
C104	LTGY	Right Rear Engine Compartment	15, 19, 23
C105 (Diesel)	GY	Right Rear Engine Compartment	5, 9, 13
C106 (Diesel)	BK	Lower Right Instrument Panel	7
C106 (Gas RHD)	GY	Lower Left Instrument Panel	N/S
C107 (Diesel LHD)	BK	Left Rear Engine Compartment	5
C107 (Gas LHD)	BK	Passenger Side Near Kick Panel	4, 37, 43
C107 (Gas RHD)	GY	Passenger Side Near Kick Panel	4, 38
C109 (LHD)	BK	Near Transfer Case switch	17
C110 (Diesel)	GY	Top of Engine Near Glow Plugs	5, 9
C111	BK	Left Front Frame Near Windshield Washer Pump	1, 4, 5
C112	BK	Right Front Frame Near Horns	1, 6, 7
C113 (Diesel)	LTGY	Rear of Engine	9, 13
C200 (LHD)	BK/GY	Passenger Side Near Kick Panel	24, 28, 43
C200 (RHD)	BK	Passenger Side Near Kick Panel	25, 29
C201 (Diesel)	WT	Below Center Floor Console, Near Park Brake	24, 27, 28, 29
C202 (MTC)	WT	HVAC unit, Right Side of Instrument Panel	24, 25, 28, 29
C202 (AZC)	WT	HVAC unit, Right Side of Instrument Panel	24, 25, 27, 28
C203 (AZC)	WT	HVAC Unit, Right Side of Instrument Panel	24, 25, 28, 29
C300	DKGY	Near Junction Block	37, 41

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
C301 (RHD)	BK	Near Junction Block	38
C302	BK	At Driver Door	31, 32, 37, 38
C303	WT	Right Rear Door	36, 42, 44
C304	BK	Under Driver Seat	39,41, 44
C306	BK	Under Passenger Seat	39,42, 43
C307	WT	Left Rear Door	35, 41, 43
C308	WT	Top of Liftgate	45, 46
C309	WT	Left Rear Quarter Pillar	45
C310 (Export)	LT GY	Above Left Quarter Wheel Housing	45, 47
C310 (Except Export)	LT GN	Above Left Quarter Wheel Housing	47
C311	WT	Top of Liftgate	46
C312	BK	Center of Liftgate	46
C313	WT	In Driver Door	31, 32
C314	LT GY	At Passenger Door	33, 34, 38
C315		To Rear of Right Quarter Window	40
C316 (Except Export)	WT	Left Bulkhead, Near Control Pedal	N/S
C317		Above B Pillar	N/S
Camshaft Position Sensor (Diesel)	BK	Top of Engine	9, 12
Camshaft Position Sensor (Gas)	GY	Right Side of Engine	15, 16, 19, 20
Capacitor (4.0L)	BK	Right Rear of Engine	15
Capacitor NO. 1 (4.7L)	BK	Right Side of Engine	19, 20
Capacitor NO. 2 (4.7L)	BK	Left Side of Engine	18
Cargo Lamp	WT	In Headliner Near Liftgate	N/S
Center High Mounted Stop Lamp	BK	Top of Liftgate	N/S
Cigar Lighter	GY	Center of Instrument Panel	24, 25
Clockspring - C1	BK	At Steering Column	30
Clockspring - C2	YL	At Steering Column	30
Clockspring - C3	GY	At Steering Column	30
Clockspring - C4	BK	At Steering Column	30
Coil On Plug NO. 1 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.1	18
Coil On Plug NO. 2 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.2	19, 20
Coil On Plug NO. 3 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.3	18
Coil On Plug NO. 4 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.4	19, 20
Coil On Plug NO. 5 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.5	18

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Coil On Plug NO. 6 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.6	19, 20
Coil On Plug NO. 7 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.7	18
Coil On Plug NO. 8 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.8	19, 20
Coil Rail (4.0L)	BK	Right Rear of Engine	15, 16
Compact Disc Changer (Premium Radio)	BK	Near Radio	24, 25
Compact Disc Changer (Rear)	BK	Right Rear Quarter Panel	45
Controller Antilock Brake	BK	Left Front Engine Compartment	4, 5
Coolant Level Sensor	LT GY	Right Rear of Engine	6, 7
Crankcase Heater (Diesel)	BK	At top of Inlet Air Hose to Turbo	13
Crankshaft Position Sensor (Diesel)	BK	Rear of Engine Near Transmission Bell Housing	9,11
Crankshaft Position Sensor (Gas)	BK	Rear of Engine Near Transmission Bell Housing	15, 16, 19, 20, 22
Data Link Connector	BK	Under Lower Driver's Side of Instrument Panel	28, 29
Driver Airbag Squib 1	BK	In Steering Wheel	30
Driver Airbag Squib 2	GN	In Steering Wheel	30
Driver Blend Door Motor/ Actuator (LHD, AZC)	BK	On HVAC Housing	N/S
Driver Blend Door Motor/ Actuator (RHD, AZC)	BK	On HVAC Unit	N/S
Driver Curtain Airbag Squib	YL	Between C and D Pillar	45
Driver Cylinder Lock Switch	GY	In Driver Door	31, 32
Driver Door Lock Motor/Ajar Switch	BK	In Driver Door	31, 32
Driver Door Module - C1	WT	In Driver Door	31, 32
Driver Door Module - C2	BK	In Driver Door	N/S
Driver Door Module - C3	BK	In Driver Door	N/S
Driver Front Door Courtesy Lamp	BK	In Driver Door	N/S
Driver Front Power Window Motor	BK	In Driver Door	31, 32
Driver Heated Seat Back (Heated Seat/Premium I/III)	GY	At Driver Seat	39
Driver Heated Seat Cushion (Heated Seat/Premium I/III)	GY	At Driver Seat	39
Driver Heated Seat Switch	WT	Center of Instrument Panel	24, 25, 28
Driver Lumbar Motor (Midline/Premium)	BK	At Driver Seat	39

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Driver Lumbar Switch (Midline/Premium)	WT	At Driver Seat	N/S
Driver Power Mirror	BK	At Driver Door	N/S
Driver Power Seat Front Riser Motor	RD	At Driver Seat	N/S
Driver Power Seat Front Riser Motor Sensor (Premium II/III)	BK	At Driver Seat	N/S
Driver Power Seat Horizontal Motor	BK	At Driver Seat	N/S
Driver Power Seat Horizontal Motor Sensor (Premium II/III)	BK	At Driver Seat	N/S
Driver Power Seat Rear Riser Motor	RD	At Driver Seat	N/S
Driver Power Seat Rear Riser Motor Sensor (Premium II/III)		At Driver Seat	N/S
Driver Power Seat Recliner Motor	BK	At Driver Seat	N/S
Driver Power Seat Recliner Motor Sensor (Premium II/III)	BK	At Driver Seat	N/S
Driver Power Seat Switch	GN	On Side of Driver Seat	N/S
Driver Rear Power Window Motor	BK	In Left Rear Door	35
Driver Rear Power Window Switch	BL	In Left Rear Door	35
Driver Seat Belt Switch	DKGY	At Switch	N/S
Driver Seat Belt Tensioner	YL		
Driver Side Impact Sensor	BK	Below Driver Seat	N/S
EGR Solenoid (Diesel)	BK	Left Front Fender	9, 13
Electronic Speed Control Servo	BK	Right Front of Engine Compartment	6
Engine Control Module C1 (Diesel)	BK	Left Front of Engine	9, 13
Engine Control Module C2 (Diesel)	BK	Left Front of Engine	9, 13
Engine Coolant Temperature Sensor (Diesel)	BK	Top of Engine	12
Engine Coolant Temperature Sensor (GAS)	BK	Right Front of Engine	14, 18
Engine Oil Pressure Sensor(DIESEL)	BK	Right Side of Engine	11
Engine Oil Pressure Sensor(GAS)	BK	Side of Engine	15, 16, 18
EVAP/Purge Solenoid	BK	Left Front Fender Near Controller Antilock Brake	4

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
EVAP Temp Sensor	WT	Behind Left Corner of the Glove Box RHD Similar	26
Front Power Outlet	GY	Center of Instrument Panel	24, 25
Front Washer Pump	WT	Left Front of Engine Compartment	4, 5
Front Wiper Motor	BK	Left Side of Cowl	4, 5
Fuel Injector No.1	BK	At Injector	12, 14, 18
Fuel Injector No.2	BK	At Injector	12, 14, 19, 20
Fuel Injector No.3	BK	At Injector	12, 14, 18
Fuel Injector No.4	BK	At Injector	12, 14, 19, 20
Fuel Injector No.5	BK	At Injector	12, 14, 18
Fuel Injector No.6	BK	At Injector	14, 19, 20
Fuel Injector No.7 (4.7L)	BK	At Injector	18
Fuel Injector No.8 (4.7L)	BK	At Injector	19, 20
Fuel Pressure Sensor (Diesel)	BK	Right Front of Engine	9, 10, 12
Fuel Pressure Solenoid (Diesel)	BK	Top of Engine	9, 12
Fuel Pump Module (Gas)	BK	Near Fuel Tank	41, 43
Fuel Tank Module (Diesel)	BK	Near Fuel Tank	41, 43
Generator (Diesel)	GY	At Generator	13
Generator (Gas)	BK	At Generator	N/S
Glove Box Lamp	BK	Inside Glove Box	24, 25
Glow Plugs (Diesel)		Left Side of Engine Head	12
Headlamp Leveling Switch (Export)	WT	Driver Side of Instrument Panel	25
Hood Ajar Switch (Export)	BK	Left Side of Engine Compartment	4, 5
Horn No.1	BK	Right Front Fascia	6, 7
Horn No.2	BK	Right Front Fascia	6, 7
Hydraulic Cooling Module	BK	Right Front of Engine Compartment	6, 7
Idle Air Control Motor	BK	Left Side of Engine Near Throttle Body	14, 18
Ignition Switch - C1	WT	On Steering Column	30
Ignition Switch - C2	BK	On Steering Column	30
Input Speed Sensor (4.7L)	BK	Left Side of Transmission	21
Instrument Cluster	WT	At Instrument Cluster	24, 25
Intake Air Temperature Sensor (Gas)	DKGY	Left Side of Engine	14, 18
Intake Air Temperature Sensor (Diesel)	BK	Lower Left Front of Engine Intake	10
Intake Port Swirl Actuator (Diesel)	BK	Left Rear of Engine Block	11
Intrusion Transceiver Module (Export)	BK	In The Overhead	N/S

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Junction Block - C1	BK	At Junction Block	37, 38, 41
Junction Block - C2	BK	At Junction Block	37, 38
Junction Block - C3	BK	At Junction Block	28, 29, 37
Junction Block - C4	WT	At Junction Block	37, 38
Junction Block - C5	WT	At Junction Block	37, 38
Knock Sensor	BK	Right Rear Side of Engine, Near Coil on Plug No.8	N/S
Leak Detection Pump (Except Export)		Left Rear Quarter Behind Left Rear Tire	N/S
Left Courtesy Lamp	BK	Left Side of Instrument Panel	28, 29, 30
Left Door Handle Courtesy Lamp	WT	At Lamp	N/S
Left Fog Lamp	BK	At Lamp	4, 5
Left Front Door Speaker	WT	In Left Front Door	31, 34
Left Front Impact Sensor	BK	Left Front Frame Near Windshield Washer Pump	4, 5
Left Front Park Lamp	WT	At Lamp	2
Left Front Park/Turn Signal Lamp (Except Export)	BK	At Lamp	N/S
Left Front Side Marker Lamp (Except Export)	WT	At Lamp	N/S
Left Front Turn Signal Lamp (Export)	WT	At Lamp	2
Left Front Wheel Speed Sensor	GY	At Left Front Wheel Opening	5
Left Headlamp Leveling Motor (Export)	BK	At Motor	2
Left High Beam Headlamp	BK	At Lamp	2
Left Instrument Panel Speaker	WT	At Speaker	24, 25
Left Liftgate Ajar Switch	BK	In Liftgate	46
Left Low Beam Headlamp	GY	At Lamp	2
Left Multi-Function Switch	WT	On Steering Column	30
Left Rear Door Lock Motor/Ajar Switch	BK	In Left Rear Door	35
Left Rear Door Speaker	WT	In Left Rear Door	35
Left Rear Lamp Assembly	BK	At Lamp Assembly	45
Left Rear Wheel Speed Sensor	GY	Near Left Rear Wheel	41, 43
Left Remote Radio Switch	BK	At Switch in Steering Wheel	N/S
Left Side Impact Sensor	BK	Left Body	N/S
Left Side Repeater Lamp (Export)	BK	On Left Front Fender	4, 5
Left Visor/Vanity Lamp	BK	At Lamp	N/S

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
License Lamp No.1	BK	At Lamp	N/S
License Lamp No.2	BK	At Lamp	N/S
Liftgate Flip-Up Ajar Switch	GY	In Liftgate	46
Liftgate Flip-Up Push Button Switch	BK	In Liftgate	N/S
Liftgate Flip-Up Release Solenoid	BK	In Liftgate	46
Liftgate Power Lock Motor	BK	In Liftgate	46
Line Pressure Sensor (4.7L)	BK	Rear of Transmission	N/S
Manifold Absolute Pressure Sensor (4.0L)	BK	At Throttle Body	14
Manifold Absolute Pressure Sensor (4.7L)	BK	Right Side of Engine	18
Manual Temperature Control - C1 (MTC)	WT	Center of Instrument Panel	N/S
Manual Temperature Control - C2 (MTC)	WT	Center of Instrument Panel	N/S
Mass Air Flow Sensor (Diesel)	BK	At Bottom of Air Inlet Hose Near Air Cleaner	13
Mode Door Motor/Actuator (AZC)	BK	Right Center of Instrument Panel	N/S
Output Speed Sensor (4.0L)	GY	Left Side of Transmission	17
Output Speed Sensor (4.7L)	BK	Left Side of Transmission	21
Overhead Map/Courtesy Lamp	WT	At Overhead Console	N/S
Oxygen Sensor 1/1 Upstream (4.0L)	GY	Left Side of Engine Near Valve Cover	14
Oxygen Sensor 1/1 Upstream (4.7L)	BK	Left Side of Engine Near Engine Mount	22
Oxygen Sensor 1/2 Downstream (4.0L)	NAT	Rear of Transmission	14, 17
Oxygen Sensor 1/2 Downstream (4.7L)	BK	Right side of Trans BellHousing, Near 'Y' Pipe Wire cover Green	22
Oxygen Sensor 2/1 Upstream (4.0L)	BK	Left of Transmission	17
Oxygen Sensor 2/1 Upstream (4.7L)	BK	Right Front Lower Engine, Forward of Engine mount	19
Oxygen Sensor 2/2 Downstream (4.0L)	NAT	Rear of Transmission	N/S
Oxygen Sensor 2/2 Downstream (4.7L)	BK	Right side of Trans BellHousing, Near 'Y' Pipe	N/S
Park Brake Switch		Center Console Area, Near Airbag Control Module	27,28, 29
Park/Neutral Position Switch (4.0L)	BK	Left Side of Transmission	17

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Passenger Airbag	YL	Passenger Side of Instrument Panel	24, 25
Passenger Blend Door Motor/Actuator (AZC)	BK	Passenger Side of HVAC unit	N/S
Passenger Curtain Airbag Squib	YL	Between C and D Pillar	45
Passenger Door Lock Motor/Ajar Switch	BK	In Passenger Door	33, 34
Passenger Door Module - C1	WT	In Passenger Door	33, 34
Passenger Door Module - C2	BK	In Passenger Door	N/S
Passenger Front Door Courtesy Lamp	BK	In Passenger Door	N/S
Passenger Front Power Window Motor	BK	In Passenger Door	33, 34
Passenger Heated Seat Back (Premium I/III)	GY	At Passenger Seat	39
Passenger Heated Seat Cushion (Premium I/III)	GY	At Passenger Seat	39
Passenger Heated Seat Switch	BK	Center of Instrument Panel	24, 25, 28
Passenger Lumbar Motor (Midline/Premium)	BK	At Passenger Seat	39
Passenger Lumbar Switch (Midline/Premium)	WT	At Passenger Seat	N/S
Passenger Power Mirror	BK	In Passenger Door	N/S
Passenger Power Seat Front Riser Motor	RD	At Passenger Seat	N/S
Passenger Power Seat Horizontal Motor	RD	At Passenger Seat	N/S
Passenger Power Seat Rear Riser Motor	RD	At Passenger Seat	N/S
Passenger Power Seat Recliner Motor (Midline/Premium)	BK	At Passenger Seat	N/S
Passenger Power Seat Switch	GN	On Side of Passenger Seat	N/S
Passenger Rear Power Window Motor	BK	In Right Rear Door	36
Passenger Rear Power Window Switch	BL	In Right Rear Door	36
Passenger Seat Belt Switch		t Switch	N/S
Passenger Seat Belt Tensioner	YL		
Passenger Side Impact Sensor	BK	Below Passenger Seat	N/S
Power Amplifier - C1	WT	Under Rear Seat	42, 44

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Power Amplifier - C2	WT	Under Rear Seat	42, 44
Powertrain Control Module - C1 (Gas)	BK	Rear of Engine Compartment	6, 15, 16, 19, 20, 23
Powertrain Control Module - C2 (Gas)	WT	Rear of Engine Compartment	6, 15, 16, 19, 20, 23
Powertrain Control Module - C3 (Gas)	WT	Rear of Engine Compartment	N/S
Radiator Fan Motor	BK	At Radiator	6
Radio - C1	GY	Center of Instrument Panel	24, 25
Radio - C2	GY	Center of Instrument Panel	24, 25
Rain Sensor (Autowipe)	BK	Front Center Overhead	N/S
Rear Power Outlet (Except Base)	RD	Right Rear Quarter Panel	45
Rear Washer Pump	BK	Left Front of Engine Compartment	4, 5
Rear Window Defogger	BK	Right Upper Corner of Liftgate	46
Rear Wiper Motor	BK	In Liftgate	46
Recirculation Door Motor/ Actuator (AZC)	BK	Center of Instrument Panel	N/S
Red Brake Warning Indicator Switch	GY	At Master Cylinder	5
Remote Keyless Module (Japan)	BL	In Driver Door	32
Right Courtesy Lamp	BK	At Lamp	28
Right Door Handle Courtesy Lamp	WT	At Lamp	N/S
Right Fog Lamp	BK	At Right Front Fascia	6, 7
Right Front Door Speaker	WT	In Right Front Door	32, 33
Right Front Impact Sensor	BK	Near Right Vehicle Radiator Support	7
Right Front Park Lamp	WT	At Lamp	2
Right Front Park/Turn Signal Lamp (Except Export)	BK	At Lamp	N/S
Right Front Side Marker Lamp (Except Export)	WT	At Lamp	N/S
Right Front Turn Signal Lamp (Export)	WT	At Lamp	2
Right Front Wheel Speed Sensor	GY	In Right Front Wheel Opening	7
Right Headlamp Leveling Motor (Export)	BK	At Motor	2
Right High Beam Headlamp	BK	At Lamp	2
Right Instrument Panel Speaker	WT	At Speaker	24, 25
Right Liftgate Ajar Switch	BK	In Liftgate	46
Right Low Beam Headlamp	GY	At Lamp	2

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Right Multi-Function Switch	WT	On Steering Column	30
Right Rear Door Lock Motor/Ajar Switch	BK	In Right Rear Door	36
Right Rear Door Speaker	WT	In Right Rear Door	36
Right Rear Lamp Assembly	BK	At Lamp Assembly	45
Right Rear Wheel Speed Sensor	BK	Near Right Rear Wheel	41, 43
Right Remote Radio Switch	BK	At Switch in Steering Wheel	N/S
Right Side Repeater Lamp (Export)	BK	On Right Front Fender	6, 7
Right Visor/Vanity Lamp	BK	At Lamp	N/S
Seat Belt Switch	WT	At Driver Seat	N/S
Seat Module - C1 (Heated Seat/Premium)	BK	Under Driver Seat	N/S
Seat Module - C2 (Heated Seat/Premium)	OR	Under Driver Seat	N/S
Sentry Key Immobilizer Module	BK	On Steering Column	30
Shifter Assembly (Gas)	WT	Between Front Seats	30
Shifter Assembly C1 (Diesel)	BK	Between Front Seats	N/S
Shifter Assembly C2 (Diesel)	WT	Between Front Seats	N/S
Siren (Export)	WT	Left Front Fender	4, 5
Speed Control Switch NO. 1	BK	On Steering Wheel	N/S
Speed Control Switch NO. 2	BK	On Steering Wheel	N/S
Sunroof Control Module		At Sunroof	40
Sunroof Motor C1	WT	At Sunroof	40
Sunroof Motor C2	BK	In Overhead	40
Sunroof Switch	GY	At Switch	N/S
Temperature Valve Actuator (MTC)	BK	On HVAC Housing	N/S
Throttle Position Sensor (4.0L)	NAT	Left Side of Engine	14
Throttle Position Sensor (4.7L)	WT	Left Side of Engine	18
Trailer Tow Circuit Breaker	BK	Left Quarter Panel	N/S
Trailer Tow Connector	BK	In Rear Bumper	47
Trailer Tow Left Turn Relay	BK	Left Quarter Panel	N/S
Trailer Tow Right Turn Relay	BK	Left Quarter Panel	N/S
Transfer Case Position Sensor	BK	On Transfer Case	9
Transmission Control Module	BK	Rear of Engine Compartment	19, 20, 23
Transmission Control Module C1 (Diesel)	BK	Right Rear Side of Engine Compartment	N/S

## CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Transmission Control Module C2 (Diesel)	BK	Right Rear Side of Engine Compartment	13
Transmission Solenoid (4.0L Gas)	BK	Left Side of Transmission	17
Transmission Solenoid Assembly (Diesel)	BK	On Transmission	13
Transmission Solenoid/TRS Assembly (4.7L)	GY	Left Side of Transmission	21
Underhood Lamp	BK	At Lamp	8
Vehicle Information Center	BK	In Overhead Console	N/S
Viscous/Cabin Heater (Diesel)	BK	Right Front of Engine Above Generator	13
Washer Fluid Level Switch	GY	Left Front of Engine Compartment	4, 5
Wastegate Solenoid (Diesel)		Near Power Distribution Center	7, 10
Water In Fuel Sensor (Diesel)	BK	Left Rear of Engine Compartment	N/S

## GROUNDS

## POWER DISTRIBUTION

## DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB)
- Power Outlets

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Bus bars
- Cartridge fuses

- Circuit splice blocks
- Flashers
- Fusible links
- Standard and Micro-Relays

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components. Refer to Wiring Diagrams for complete circuit diagrams.

## OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At

## POWER DISTRIBUTION (Continued)

the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate accessories that the vehicle owner may choose to have installed in the aftermarket.

## SPECIAL TOOLS

## POWER DISTRIBUTION SYSTEMS

*Terminal Pick Kit 6680*

## CIGAR LIGHTER OUTLET

## DESCRIPTION

A cigar lighter outlet is standard equipment on this model. On models equipped with the optional Smoker's Package, the cigar lighter knob and heating element are included. On models without the Smoker's Package, the cigar lighter outlet is equipped with a snap fit plastic cap and is treated as an extra accessory power outlet. The cigar lighter outlet is installed in the instrument panel center lower bezel, which is located near the bottom of the instrument panel center stack area, below the heater and air conditioner controls. The cigar lighter outlet is secured by a snap fit within the center lower bezel.

The cigar lighter outlet, plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if faulty or damaged, they must be replaced.

## OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or outlet shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current.

The cigar lighter receives battery voltage from a fuse in the junction block when the ignition switch is in the Accessory or On positions.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the outlet shell, the heating element resistor coil is grounded through its housing to the outlet shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the outlet shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the outlet shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the outlet shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

## DIAGNOSIS AND TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open or short as required.

(3) Remove the cigar lighter knob and element from the cigar lighter outlet shell. Check for continuity between the inside circumference of the cigar lighter outlet shell and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Turn the ignition switch to the On position. Check for battery voltage at the insulated contact located at the back of the cigar lighter outlet shell. If

## CIGAR LIGHTER OUTLET (Continued)

OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument panel center lower bezel. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the Accessory or On positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter outlet. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

CIGAR LIGHTER OUTLET  
DOOR SPRING

## REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the instrument panel center lower bezel from the I.P. Refer to Body for the procedure.

80950645

**Fig. 1 Cigar Lighter Outlet Door Spring**

- 1 - CIGAR LIGHTER OUTLET
- 2 - CIGAR LIGHTER OUTLET DOOR SPRING

(3) Remove the cigar lighter outlet door spring from its locating holes (Fig. 1).

## INSTALLATION

(1) Install the cigar outlet door spring in its locating holes.

(2) Install the instrument panel center lower bezel on the I.P. Refer to Body for the procedure.

(3) Connect the negative battery cable.

## IOD FUSE

## DESCRIPTION

80bdbc8c

**Fig. 2 Ignition-Off Draw Fuse**

- 1 - POWER DISTRIBUTION CENTER
- 2 - IGNITION-OFF DRAW FUSE
- 3 - IOD FUSE STORAGE CAVITY

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse (Fig. 2) that is removed from its cavity in the Power Distribution Center (PDC) when the vehicle is shipped from the factory. Dealer personnel are to remove the IOD fuse from the storage location and install it into PDC fuse cavity 15 as part of the preparation procedures performed just prior to new vehicle delivery.

The PDC has a molded plastic cover that can be removed to provide service access to all of the fuses and relays in the PDC. An integral latch and hinges are molded into the PDC cover for easy removal. A fuse layout map is integral to the underside of the PDC cover to ensure proper fuse and relay identification. The IOD fuse is a 50 ampere maxi-type cartridge fuse and, when removed, it is stored in a spare fuse cavity within the PDC.

## IOD FUSE (Continued)

## OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is removed is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is removed from PDC fuse cavity 15 when the vehicle is shipped from the assembly plant. Dealer personnel must install the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that removing the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Battery System** for additional service information.

## REMOVAL

The Ignition-Off Draw (IOD) fuses normal installation location is cavity 15 in the power distribution center. When the vehicle is shipped from the assembly plant the fuse is removed to maintain proper battery voltage during vehicle storage (in some cases). Dealer personnel must install the IOD fuse when the vehicle is being prepared for customer delivery in order to restore full electrical system operation.

- (1) Turn the ignition switch to the Off position.
- (2) Unlatch and open the cover of the power distribution center.

(3) Remove the IOD fuse from fuse **cavity 15** of the power distribution center (Fig. 2).

(4) Store the removed IOD fuse by installing it in the unused fuse storage **cavity 11** of the PDC (Fig. 2).

(5) Close and latch the power distribution center cover.

## INSTALLATION

(1) Be certain the ignition switch is in the Off position.

(2) Unlatch and open the cover of the power distribution center.

(3) Remove the stored IOD fuse from fuse storage **cavity 11** of the power distribution center.

(4) Use a thumb to press the IOD fuse firmly down into power distribution center fuse **cavity 15**.

(5) Close and latch the power distribution center cover.

## JUNCTION BLOCK

## DESCRIPTION

80b6b36f

**Fig. 3 Junction Block Location**

- 1 - REAR LATCHES
- 2 - JUNCTION BLOCK AND BODY CONTROL MODULE UNIT
- 3 - INSTRUMENT PANEL FUSE COVER
- 4 - SIDE LATCH
- 5 - FRONT LATCHES

An electrical Junction Block (JB) is concealed beneath the driver side of the instrument panel in the passenger compartment of the vehicle (Fig. 3). The JB combines the functions previously provided by a separate fuseblock module and relay center. The JB serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle. It also eliminates the need for numerous splice connections. The JB houses up to thirty-three blade-

## JUNCTION BLOCK (Continued)

type mini fuses, up to two blade-type automatic resetting circuit breakers, the electronic combination flasher, the Daytime Running Lamp (DRL) module (Canada only) and up to twelve International Standards Organization (ISO) relays (three standard-type and nine micro-type). The JB also incorporates an integral connector and mounting for the Body Control Module (BCM). The BCM is secured with four screws directly to the dash panel side of the JB. Refer to **Body Control Module** in Electronic Control Modules for additional information covering the BCM.

The molded plastic JB housing has integral mounts that are secured with two screws and two snap retainers to the instrument panel steering column support bracket behind the instrument panel steering column opening cover. The JB is concealed above the molded plastic instrument panel fuse cover. Integral latches molded into the fuse cover secure it the JB, the BCM and the 16-way data link connector tab of the instrument panel steering column support bracket. The fuse cover can be pulled downward to disengage the latches and provide service access to all of the fuses, relays and wire harness connectors of the JB. The fuse cover has a fuse puller and spare fuses secured to its upper surface. Refer to **Instrument Panel Fuse Cover** in Body for additional service information.

The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire JB unit must be replaced. The BCM is available for separate service replacement.

## OPERATION

All of the circuits entering and leaving the Junction Block (JB) do so through up to five wire harness connectors, which are connected to the JB through integral connector receptacles molded into the JB housing. Internal connection of all of the JB circuits is accomplished by a printed circuit board. There are also two separate wire harness connections to connector receptacles that are integral to the BCM. Refer to **Junction Block** in Wiring Diagrams for additional information and the location of complete JB circuit diagrams.

## REMOVAL

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE**

**BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the fuse cover from the bottom of the Junction Block (JB).

(3) Remove the steering column opening cover from the instrument panel. Refer to **Steering Column Opening Cover** in Body for the location of steering column opening cover removal procedures.

(4) Reach behind the JB to disconnect the two instrument panel wire harness connectors from the Body Control Module (BCM) connector receptacles located near the bottom of the JB (Fig. 4).

80ba7774

**Fig. 4 Junction Block Connections**

- 1 - SCREW
- 2 - JUNCTION BLOCK
- 3 - BULKHEAD CONNECTOR
- 4 - BODY CONTROL MODULE
- 5 - INSTRUMENT PANEL WIRE HARNESS CONNECTORS

(5) Reach behind the JB to remove the screw that secures the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB and disconnect the connector.

(6) Disconnect the fused B(+) and the IOD wire harness connectors from the connector receptacles located near the bottom of the JB (Fig. 5).

(7) Remove the screws that secure the right and left body wire harness bulkhead connectors to the connector receptacles located near the center of the JB and disconnect the connectors.

## JUNCTION BLOCK (Continued)

**Fig. 5 Junction Block Connections**

- 2 - SCREW
- 3 - CONNECTOR
- 4 - LEFT BODY WIRE HARNESS
- 5 - IOD CONNECTOR
- 6 - FUSED B+ CONNECTOR
- 7 - RIGHT BODY WIRE HARNESS
- 8 - SCREW
- 9 - CONNECTOR
- 10 - JUNCTION BLOCK

(8) Remove the two screws that secure the JB to the instrument panel steering column support bracket (Fig. 6).

(9) To disengage the two snap clips that secure the top of the JB to the instrument panel steering column support bracket, grasp the bottom of the junction block firmly with both hands and pull it downward sharply.

(10) Remove the JB from the instrument panel steering column support bracket.

**INSTALLATION**

**NOTE:** If the Junction Block (JB) is being replaced with a new unit, be certain to transfer each of the optional fuses, circuit breakers and relays from the faulty JB to the proper cavities of the replacement JB. Refer to Junction Block in Wiring Diagrams for the location of complete circuit diagrams and cavity assignments for the JB. The Body Control Module (BCM) must also be transferred to the new JB. Refer to Body Control Module in Electronic Control

**Fig. 6 Junction Block**

- 1 - SCREW (2)
- 2 - DRIVER SIDE COURTESY LAMP
- 3 - JUNCTION BLOCK
- 4 - 16 WAY DATA LINK CONNECTOR

**Modules for the location of the BCM removal and installation procedures.**

(1) Position the JB into its mounting location on the instrument panel steering column support bracket.

(2) Align the snap clips at the top of the JB with the mounting holes in the instrument panel steering column support bracket.

(3) Grasp the bottom of the JB firmly with both hands and push it upward sharply to engage the two snap clips that secure the top of the JB to the instrument panel steering column support bracket.

(4) Install and tighten the two screws that secure the JB to the instrument panel steering column support bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reconnect the right and left body wire harness bulkhead connectors to the connector receptacles located near the center of the JB.

(6) Install and tighten the screws that secure the right and left body wire harness bulkhead connectors to the connector receptacles located near the center of the JB. Tighten the screws to 2.2 N·m (20 in. lbs.).

(7) Reconnect the fused B(+) and the IOD wire harness connectors to the connector receptacles located near the bottom of the JB.

(8) Reach behind the JB to reconnect the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB.

(9) Install and tighten the screw that secures the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB. Tighten the screw to 2.2 N·m (20 in. lbs.).

(10) Reach behind the JB to reconnect the two instrument panel wire harness connectors to the

## JUNCTION BLOCK (Continued)

BCM connector receptacles located near the bottom of the JB.

(11) Install the steering column opening cover onto the instrument panel. Refer to **Steering Column Opening Cover** in Body for the location of the steering column opening cover installation procedures.

(12) Install the fuse cover onto the bottom of the JB.

(13) Reconnect the battery negative cable.

## POWER DISTRIBUTION CENTER

### DESCRIPTION

**Fig. 7 Power Distribution Center Location**

- 1 - RIGHT FENDER
- 2 - BATTERY
- 3 - POWER DISTRIBUTION CENTER
- 4 - COVER

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC) (Fig. 7). The molded plastic PDC housing is located in the right front corner of the engine compartment, between the battery and the right front inner fender shield. The PDC houses up to fifteen maxi-type cartridge fuses, which replace all in-line fusible links. The PDC also houses up to thirteen blade-type mini fuses, and up to ten International Standards Organization (ISO) relays (two standard-type and eight micro-type).

The PDC housing is secured in the engine compartment at three points. Integral mounts on both sides of the PDC housing engage and latch to stanchions

that are integral to the molded plastic battery support. The PDC is integral to the right headlamp and dash wire harness, which exits from the bottom of the PDC housing. The PDC housing has a molded plastic cover that includes two integral latches at the front and pivot hooks at the back that snap over a hinge pin on the rear of the PDC housing. The PDC cover is easily opened or removed for service access and has a convenient fuse and relay layout map integral to the inside surface of the cover to ensure proper component identification. A fuse puller is also stored on the inside of the PDC cover.

The PDC cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC main housing unit, the fuse wedges and the bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, fuse wedges or the bus bars are faulty or damaged, the right headlamp and dash wire harness unit must be replaced.

### OPERATION

All of the current from the battery and the generator output enters the PDC through two cables and a single two-holed eyelet that is secured with nuts to the two PDC B(+) terminal studs just inside the front end of the PDC housing. The PDC cover is unlatched and opened to access the battery and generator output connection B(+) terminal studs, the fuses or the relays. Internal connection of all of the PDC circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Power Distribution** in Wiring Diagrams for the location of complete PDC circuit diagrams.

### REMOVAL

The Power Distribution Center (PDC) main housing unit, the PDC fuse wedges and the PDC bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, the fuse wedges or the bus bars are faulty or damaged, the entire PDC and right headlamp and dash wire harness unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect each of the right headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness connector locations.

(3) Remove all of the fasteners that secure each of the right headlamp and dash wire harness ground eyelets to the vehicle body and chassis components.

## POWER DISTRIBUTION CENTER (Continued)

Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.

(4) Disengage each of the retainers that secure the right headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness retainer locations.

(5) Unlatch and open the PDC cover.

(6) Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take outs to the PDC B(+) terminal studs (Fig. 8).

**Fig. 8 Power Distribution Center Connections**

- 1 - PDC COVER
- 2 - NUT (2)
- 3 - EYELET
- 4 - B(+) TERMINAL STUDS

(7) Remove the battery wire harness PDC take out eyelet from the B(+) terminal studs.

(8) Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions of the battery support, and pull the PDC housing upward to disengage the mounts from the stanchions (Fig. 9).

(9) Remove the PDC and the right headlamp and dash wire harness from the engine compartment as a unit.

80be4558

**Fig. 9 Power Distribution Center Remove/Install**

## DISASSEMBLY

## POWER DISTRIBUTION CENTER DISASSEMBLY

## PDC HOUSING LOWER COVER REMOVAL

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the battery from the battery support. Refer to **Battery System** for the location of the battery removal procedures.

(2) Unlatch and remove the cover from the PDC.

(3) Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take out to the B(+) terminal studs near the front of the PDC.

(4) Remove the battery wire harness PDC take out eyelet from the two PDC B(+) terminal studs.

(5) Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions on the battery support, and pull the PDC

## POWER DISTRIBUTION CENTER (Continued)

housing upward to disengage the mounts from the stanchions.

(6) Where the right headlamp and dash wire harness exits the PDC, remove the tape that secures the wire harness to the trough formation on the PDC housing lower cover.

(7) Using a trim stick or another suitable wide flat-bladed tool, gently pry the latches on each side and the front of the PDC housing that secure the housing lower cover to the PDC and remove the housing lower cover (Fig. 10).

80be453f

**Fig. 10 PDC Housing Lower Cover Remove/Install - Typical**

- 1 - TROUGH FORMATION
- 2 - LATCHES (5)
- 3 - PDC HOUSING LOWER COVER
- 4 - WIRE HARNESS

## PDC B+ TERMINAL MODULE REMOVAL

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the PDC housing lower cover.

(2) From the top of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches that secure the B(+) terminal module in the PDC.

(3) Gently and evenly press the two B(+) terminal studs down through the bus bar in the PDC.

(4) From the bottom of the PDC housing, remove the B(+) terminal module from the PDC.

## PDC RELAY WEDGE REMOVAL

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the PDC housing lower cover.

(2) Remove each of the relays from the PDC relay wedge to be removed.

(3) From the bottom of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches (yellow) that secure the relay wedge to the PDC relay cassette.

(4) From the top of the PDC housing, remove the relay wedge from the PDC relay cassette (Fig. 11).

80be4542

**Fig. 11 PDC Relay Wedge Remove/Install - Typical**

- 1 - RELAY WEDGE (TYPICAL)
- 2 - PDC HOUSING

## PDC RELAY CASSETTE REMOVAL

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud

## POWER DISTRIBUTION CENTER (Continued)

module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the relay wedge from the PDC relay cassette to be removed.

**NOTE:** It may be necessary to remove relay cassettes that are not being serviced from the PDC housing in order to obtain sufficient clearance to access the faulty relay cassette. The same service procedure is repeated as necessary to remove each of the interfering relay wedges and relay cassettes from the PDC housing.

(2) From the top of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches that secure the relay cassette in the PDC (Fig. 12).

**Fig. 12 PDC Relay Cassette Latches - Typical**

- 1 - LATCHES
- 2 - FROM SPECIAL TOOL KIT 6680
- 3 - PDC RELAY CASSETTES (TYPICAL)

(3) Gently and evenly press the relay cassette down through the PDC housing.

(4) From the bottom of the PDC housing, remove the relay cassette from the PDC (Fig. 13).

**CAUTION:** Do not remove the wiring and terminals from the terminal cavities of the faulty PDC relay cassette at this time. Refer to the Assembly procedure that follows for the proper procedures for

80be4544

**Fig. 13 PDC Relay - Typical**

- 1 - PDC HOUSING
- 2 - PDC RELAY CASSETTE (TYPICAL)
- 3 - LATCHES

transferring the wiring and terminals to the replacement PDC relay cassette.

## ASSEMBLY

### POWER DISTRIBUTION CENTER ASSEMBLY

#### PDC B(+) TERMINAL MODULE INSTALLATION

(1) From the bottom of the PDC housing, align and insert the B(+) terminal module into the PDC.

(2) From the bottom of the PDC housing, align and insert the two studs of the PDC B(+) terminal module through the bus bar in the PDC.

(3) From the bottom of the PDC housing, press the B(+) terminal module gently and evenly into the PDC until both of the latches are fully engaged.

(4) Install the PDC housing lower cover.

#### RELAY WEDGE INSTALLATION

(1) From the top of the PDC housing, align and insert the PDC relay wedge latch arms into the correct cavities in the relay cassette.

(2) Gently and evenly press the PDC relay wedge down into the relay cassette until both of the latches are fully engaged.

(3) Install each of the removed relays into the proper cavities of the PDC relay wedge.

(4) Install the PDC housing lower cover.

## POWER DISTRIBUTION CENTER (Continued)

## RELAY CASSETTE INSTALLATION

(1) Move the faulty PDC relay cassette with its wiring away from the bottom of the PDC housing far enough to allow the replacement relay cassette to be installed into the PDC.

(2) Using the faulty relay cassette as a guide, be certain that the replacement relay cassette is correctly oriented before installing it into the PDC housing.

(3) From the bottom of the PDC housing, align and insert the replacement relay cassette into the PDC. Press the relay cassette up into the PDC until both of the latches are fully engaged.

**CAUTION:** Proper care must be taken to be certain that the wiring and terminals from the faulty PDC relay cassette are installed in the correct terminal cavities of the replacement relay cassette. To prevent mistakes it is recommended that the wiring and terminals be removed from the faulty relay cassette one cavity at a time, repaired or spliced as necessary, then installed securely into the correct cavity of the replacement relay cassette. If you are not absolutely certain into which cavity a terminal should be installed, refer to Power Distribution in the index of this service manual for the location of complete circuit diagrams covering the PDC.

(4) While pulling gently on the wire from the bottom of the faulty PDC relay cassette, use a terminal pick tool (Special Tool Kit 6680) from the top of the relay cassette to release the latch that secures the terminal in the relay cassette terminal cavity (Fig. 14).

(5) From the bottom of the faulty PDC relay cassette, remove the wire and terminal from the relay cassette terminal cavity.

(6) Make all necessary repairs and splices to the wire for the removed terminal. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(7) From the bottom of the PDC housing, align and insert the removed wire and terminal into the correct terminal cavity of the replacement relay cassette. Push the wire and terminal up into the relay cassette terminal cavity until it is fully engaged by the latch.

(8) Repeat Step 4, Step 5, Step 6 and Step 7 one wire and terminal at a time until each of the wires and terminals have been transferred from the faulty PDC relay cassette into the replacement relay cassette.

(9) Install the PDC relay wedge into the replacement PDC relay cassette.

## PDC LOWER COVER INSTALLATION

(1) Align the PDC housing lower cover on the bottom of the PDC.

**Fig. 14 PDC Relay Cassette Terminal Remove/Install**

- 1 - TERMINAL CAVITIES (TYPICAL)
- 2 - PDC RELAY CASSETTE (TYPICAL)
- 3 - TERMINAL LATCHES (TYPICAL)
- 4 - FROM SPECIAL TOOL KIT 6680

(2) Evenly press the lower cover into place until latches are fully engaged.

(3) Where the right headlamp and dash harness enters the PDC, tape the harness securely to the trough formation on the PDC lower cover.

(4) Install the PDC in its mounting location on the battery support.

(5) Install the battery wire harness over the two PDC B+ terminal studs. Torque the nuts to 11.3 N·m (100 in. lbs.).

(6) Install the battery. Refer to Battery System for the procedure.

(7) Install the PDC cover.

## INSTALLATION

The Power Distribution Center (PDC) main housing unit, the PDC fuse wedges and the PDC bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, the fuse wedges or the bus bars are faulty or damaged, the entire PDC and right headlamp and dash wire harness unit must be replaced.

(1) Position the PDC and the right headlamp and dash wire harness unit in the engine compartment.

(2) Engage the PDC housing mounts with the stanchions of the battery support and push the unit downward until the mount latches fully engage the mounting tabs on the stanchions.

(3) Install the two-holed eyelet of the battery wire harness PDC take outs onto the two PDC B(+) terminal studs.

## POWER DISTRIBUTION CENTER (Continued)

(4) Install and tighten the nuts that secure the eyelet of the battery wire harness PDC take outs to the B(+) terminal studs. Tighten the nuts to 11.3 N·m (100 in. lbs.).

(5) Engage each of the retainers that secure the right headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness retainer locations.

(6) Install all of the fasteners that secure each of the right headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.

(7) Reconnect each of the right headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness connector locations. For connectors secured with screws, tighten the screws to 4.3 N·m (38 in. lbs.).

(8) Reconnect the battery negative cable.

## POWER OUTLET

## DESCRIPTION - FRONT POWER OUTLET

An accessory power outlet is standard equipment on this model. The power outlet is installed in the instrument panel center lower bezel, which is located near the bottom of the instrument panel center stack area, below the heater and air conditioner controls. The power outlet base is secured by a snap fit within the center lower bezel. A hinged door with an over-center spring flips closed to conceal and protect the power outlet base when the power outlet is not being used, and flips open below the center lower bezel while the power outlet is in use.

The power outlet receptacle unit and the power outlet door are each available for service replacement.

## OPERATION - FRONT POWER OUTLET

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the junction block at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

## DIAGNOSIS AND TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

**WARNING: REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.

(3) Open the power outlet door. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the instrument panel center lower bezel. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center lower bezel from the instrument panel. Refer to **Instrument Panel Center Lower Bezel** in Body for the procedure.

(3) Pull the cigar lighter knob and element or the protective cap out of the cigar lighter receptacle base, or open the power outlet door in the instrument panel center lower bezel.

(4) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the

## POWER OUTLET (Continued)

receptacle base to the instrument panel center lower bezel (Fig. 15).

**Fig. 15 Cigar Lighter and Power Outlet Remove/Install - Typical**

- 1 - KNOB AND ELEMENT
- 2 - RETAINING BOSSES-ENGAGE PLIERS HERE
- 3 - BASE
- 4 - PARTIALLY REMOVED
- 5 - EXTERNAL SNAP-RING PLIERS
- 6 - MOUNT
- 7 - BASE

(5) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(6) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(7) Remove the cigar lighter or power outlet mount from the instrument panel center lower bezel.

## INSTALLATION

(1) Install the cigar lighter or power outlet mount into the instrument panel center lower bezel.

(2) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(3) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(4) Install the cigar lighter knob and element or the protective cap into the cigar lighter receptacle

base, or close the power outlet door in the instrument panel center lower bezel.

(5) Install the center lower bezel onto the instrument panel. Refer to **Instrument Panel Center Lower Bezel** in Body for the procedure.

(6) Reconnect the battery negative cable.

## POWER OUTLET RELAY

## DESCRIPTION

The power outlet / cigar lighter relay is an electro-mechanical device that switches fused battery current to the cigar lighter or power outlet when the ignition switch is turned to the Accessory or On positions. The power outlet / cigar lighter relay is located in the junction block, below the driver side of the instrument panel in the passenger compartment.

The cigar lighter relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The cigar lighter relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

## OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

## DIAGNOSIS AND TESTING - POWER OUTLET RELAY

The power outlet / cigar lighter relay (Fig. 16) is located in the junction block, below the driver side end of the instrument panel in the passenger compartment. For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

## POWER OUTLET RELAY (Continued)

**WARNING: REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Remove the power outlet / cigar lighter relay from the junction block. Refer to the procedure in this group.

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be  $75 \pm 5$  ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

**Fig. 16 Accessory Relay**

TERMINAL LEGEND

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

### DIAGNOSIS AND TESTING - RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) of the junction block is connected to battery voltage and should be hot at all times. Check for battery voltage at the fused B(+) circuit cavity in the junction block receptacle for the cigar lighter relay. If OK, go to Step 2. If not OK, repair the fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the fused B(+) fuse in the junction block that feeds the cigar lighter when the relay is energized by the ignition switch. There should be continuity between the junction block cavity for relay terminal 87 and the fused B(+) fuse in the junction block at all times. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

(4) The coil ground terminal (85) is connected to the electromagnet in the relay. It receives battery feed to energize the cigar lighter relay when the ignition switch is in the Accessory or On positions. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity for relay terminal 85 in the junction block receptacle for the cigar lighter relay. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (acc/run) circuit to the ignition switch as required.

(5) The coil battery terminal (86) is connected to the electromagnet in the relay. The junction block cavity for this terminal should have continuity to ground at all times. If not OK, repair the open ground circuit to ground as required.

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the steering column opening cover from the instrument panel. Refer to **Steering Column Opening Cover** in Body for the procedure.

(3) The power outlet / cigar lighter relay is located on the left side of the combination flasher in the junction block.

(4) Remove the power outlet / cigar lighter relay from the junction block.

### INSTALLATION

(1) Position the power outlet / cigar lighter relay in the proper receptacle in the junction block.

(2) Align the power outlet / cigar lighter relay terminals with the terminal cavities in the junction block receptacle.

(3) Push in firmly on the power outlet / cigar lighter relay until the terminals are fully seated in the terminal cavities in the junction block receptacle.

(4) Install the steering column opening cover onto the instrument panel. Refer to **Steering Column Opening Cover** in Body for the procedure.

(5) Reconnect the battery negative cable.

## IOD WIRE HARNESS CONNECTOR

### DESCRIPTION

**Fig. 17 Ignition-Off Draw Connector**

- 1 - SNAP CLIPS
- 2 - SCREW
- 3 - CONNECTOR
- 4 - LEFT BODY WIRE HARNESS
- 5 - IOD CONNECTOR
- 6 - FUSED B+ CONNECTOR
- 7 - RIGHT BODY WIRE HARNESS
- 8 - SCREW
- 9 - CONNECTOR
- 10 - JUNCTION BLOCK

All vehicles are equipped with an Ignition-Off Draw (IOD) connector that is located in a molded connector receptacle on the lower rear surface of the Junction Block (JB) housing (Fig. 17). The JB is concealed above the molded plastic instrument panel fuse cover. Integral latches molded into the fuse cover secure it the JB, the Body Control Module (BCM) and the 16-way data link connector tab of the instrument panel steering column support bracket. The fuse cover can be pulled downward to disengage the latches and provide service access to all of the fuses, relays and wire harness connectors of the JB. Refer to **Instrument Panel Fuse Cover** in the index of this service manual for the location of additional service information covering the fuse cover.

### OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD connector feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock.

The IOD connector can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about twenty days (short-term storage). Simply disconnect the IOD connector from the JB receptacle. However, it must be remembered that disconnecting the IOD connector will not eliminate IOD, but only reduce this normal condition. When a vehicle will not be used for more than twenty days, but less than thirty days, remove the IOD fuse from the Power Distribution Center (PDC). If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Ignition-Off Draw Fuse** and **Battery** in the index in this service manual for the location of additional service information covering the ignition-off draw fuse and the battery.

## FUSE COVER

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull down on the rear edge (nearest the rear of the vehicle) of the instrument panel fuse cover until the rear latches unsnap from the tabs on the lower junction block housing and the side latch unsnaps from the tab on the instrument panel steering column support bracket outboard of the 16-way data link connector (Fig. 18).

(3) Move the instrument panel fuse cover towards the front of the vehicle to disengage the front latches from the mounting slots in the lower housing of the body control module.

(4) Remove the fuse cover from under the instrument panel.

## FUSE COVER (Continued)

80b6b36f

**Fig. 18 Instrument Panel Fuse Cover Remove/Install**

- 1 - REAR LATCHES
- 2 - JUNCTION BLOCK AND BODY CONTROL MODULE UNIT
- 3 - INSTRUMENT PANEL FUSE COVER
- 4 - SIDE LATCH
- 5 - FRONT LATCHES

**INSTALLATION**

(1) Position the two front latches of the instrument panel fuse cover within the two locator channel formations on the bottom of the body control module housing (Fig. 19).

80b76f92

**Fig. 19 Instrument Panel Fuse Cover Locator Channels**

- 1 - JUNCTION BLOCK
- 2 - SCREWS (4)
- 3 - BODY CONTROL MODULE
- 4 - FUSE COVER LOCATOR CHANNELS
- 5 - FUSE COVER MOUNTING SLOTS
- 6 - INSTRUMENT PANEL WIRE HARNESS CONNECTORS

(2) While applying a slight upward pressure to the instrument panel fuse cover over the front latches,

slowly slide the front latches through the locator channels toward the front of the vehicle until the latches exit the front of the locator channels. This will locate the front latches at the mounting slots in the lower housing of the body control module.

(3) Apply a slight rearward pressure on the instrument panel fuse cover to engage the front latches in the mounting slots in the lower housing of the body control module.

(4) Swing the rear edge (nearest the rear of the vehicle) of the instrument panel fuse cover up toward the junction block.

(5) Press firmly upward on the instrument panel fuse cover over the rear latches until the latches snap into place over the tabs on the lower edge of the junction block housing.

(6) Press firmly upward on the 16-way data link connector cover formation of the instrument panel fuse cover until the side latch snaps into place over the tab on the outboard side of the instrument panel steering column support bracket.

(7) Reconnect the battery negative cable.

**REAR POWER OUTLET****DESCRIPTION - REAR POWER OUTLET**

A rear accessory power outlet is optional equipment on this model. The rear power outlet is installed in the lower right quarter trim panel near the right liftgate opening pillar in the cargo area of the vehicle. The power outlet base and mount are secured by a snap fit within the quarter trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use. While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

**OPERATION - REAR POWER OUTLET**

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Power Distribution Center (PDC) through a fuse in the Junction Block (JB) at all times. Refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Dia-

## REAR POWER OUTLET (Continued)

grams for the location of complete rear power outlet circuit diagrams.

## DIAGNOSIS AND TESTING - REAR POWER OUTLET

Refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams for the location of complete rear power outlet circuit diagrams.

(1) Check the fused B(+) fuse in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the Power Distribution Center (PDC) as required.

(3) Remove the plastic protective cap from the rear power outlet receptacle. Check for continuity between the inside circumference of the rear power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the rear power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the rear power outlet from the right quarter trim panel. Check for continuity between the ground circuit cavity of the rear power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the rear power outlet wire harness connector. If OK, replace the faulty rear power outlet receptacle base. If not OK, repair the open fused B(+) circuit to the JB fuse as required.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the protective cap out of the rear power outlet receptacle base (Fig. 20).

(3) Look inside the rear power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the right quarter trim panel (Fig. 21).

(4) Insert a pair of external snap ring pliers into the rear power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

**Fig. 20 Rear Power Outlet Remove/Install**

- 7 - BASE

## REAR POWER OUTLET (Continued)

(6) Pull the rear power outlet receptacle base away from the right quarter trim panel far enough to access the wire harness connector.

(7) Disconnect the right body wire harness connector from the rear power outlet receptacle base connector receptacle.

(8) Remove the rear power outlet mount from the right quarter trim panel.

**INSTALLATION**

(1) Align the splines on the outside of the rear power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(2) Insert the rear power outlet receptacle base about half way through the mount.

(3) Reconnect the right body wire harness connector to the rear power outlet receptacle base connector receptacle.

(4) Insert the rear power outlet receptacle base and mount into the right quarter trim panel as a unit until the mount is seated flush against the trim panel.

(5) Press firmly on the rear power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(6) Install the protective cap into the rear power outlet receptacle base.

(7) Reconnect the battery negative cable.

## ENGINE - 4.0L

### DESCRIPTION

The 4.0 Liter (242 CID) six-cylinder engine is an In-line, lightweight, overhead valve engine. This engine is designed for unleaded fuel.

The engine cylinder head has dual quench-type combustion chambers that create turbulence and fast burning of the air/fuel mixture. This results in better fuel economy.

The cylinders are numbered 1 through 6 from front to rear. The firing order is 1-5-3-6-2-4 (Fig. 1).

The crankshaft rotation is clockwise, when viewed from the front of the engine. The crankshaft rotates within seven main bearings. The camshaft rotates within four bearings.

80b770a2

**Fig. 1 Engine Firing Order**

The engine Build Date Code is located on a machined surface on the right side of the cylinder block between the No.2 and No.3 cylinders (Fig. 2).

The digits of the code identify:

- 1st Digit—The year (8 = 1998).
- 2nd & 3rd Digits—The month (01 - 12).
- 4th & 5th Digits—The engine type/fuel system/compression ratio (MX = A 4.0 Liter (242 CID) 8.7:1 compression ratio engine with a multi-point fuel injection system).
- 6th & 7th Digits—The day of engine build (01 - 31).

(1) **FOR EXAMPLE:** Code \* 801MX12 \* identifies a 4.0 Liter (242 CID) engine with a multi-point fuel injection system, 8.7:1 compression ratio and built on January 12, 1998.

**Fig. 2 Build Date Code Location**

## DIAGNOSIS AND TESTING

### DIAGNOSIS AND TESTING - ENGINE

#### DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING)
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING)
- Lash Adjuster (Tappet) Noise Diagnosis (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - DIAGNOSIS AND TESTING)
- Engine Oil Leak Inspection (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

## DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

## DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

**WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.**

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

(8) All gauge pressure indications should be equal, with no more than 25% leakage.

(9) **FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

## ENGINE - 4.0L (Continued)

## CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

## DIAGNOSIS AND TESTING—REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
  - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
- (4) If no leaks are detected, pressurized the crankcase as outlined in (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

**CAUTION:** Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION:** Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to the service Diagnosis—Mechanical, under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL), for proper replacement procedures.

## STANDARD PROCEDURE

## STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

## ENGINE - 4.0L (Continued)

**MOPAR® ENGINE RTV GEN II**

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® ATF RTV**

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® GASKET MAKER**

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

**MOPAR® GASKET SEALANT**

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

**FORM-IN-PLACE GASKET AND SEALER APPLICATION**

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the

center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

**STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS**

**CAUTION:** Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

**STANDARD PROCEDURE—HYDROSTATIC LOCK**

**CAUTION:** DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

## ENGINE - 4.0L (Continued)

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

## STANDARD PROCEDURE - CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

**CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.**

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

**CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.**

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 40° to 60° for proper seating of rings (Fig. 3).

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40° to 60° angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush

8086fd41

**Fig. 3 Cylinder Bore Crosshatch Pattern**

- 1 - CROSSHATCH PATTERN  
2 - INTERSECT ANGLE

to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

## STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 4).

**CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.**

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

## REMOVAL

- (1) Disconnect the battery negative cable.

## ENGINE - 4.0L (Continued)

**Fig. 4 Core Hole Plug Removal**

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

(2) Mark the hinge locations on the hood panel for alignment reference during installation. Remove the engine compartment lamp. Remove the hood.

(3) Remove the radiator drain cock and radiator cap to drain the coolant. DO NOT waste usable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(4) Remove the upper radiator hose and coolant recovery hose.

(5) Remove the lower radiator hose.

(6) Remove upper radiator support retaining bolts and remove radiator support.

(7) Remove the fan assembly from the water pump (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(8) Remove the fan shroud.

(9) Disconnect the transmission fluid cooler lines (automatic transmission).

(10) Discharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(11) Remove the service valves and cap the compressor ports.

(12) Remove the radiator or radiator/condenser (if equipped with A/C).

(13) Disconnect the heater hoses at the engine thermostat housing and water pump.

(14) Disconnect the accelerator cable, transmission line pressure cable and speed control cable (if equipped) from the throttle body.

(15) Remove cables from the bracket and secure out of the way.

(16) Disconnect the body ground at the engine.

(17) Disconnect the following connectors and secure their harness out of the way.

- Power steering pressure switch
- Coolant temperature sensor
- Six (6) fuel injector connectors
- Intake air temperature sensor
- Throttle position sensor
- Map sensor
- Crankshaft position sensor
- Oxygen sensor
- Camshaft position sensor
- Generator connector and B+ terminal wire

(18) Disconnect the coil rail electrical connections and the oil pressure switch connector.

(19) Perform the fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(20) Disconnect the fuel supply line at the injector rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(21) Remove the fuel line bracket from the intake manifold.

(22) Remove the air cleaner assembly (Fig. 5).

(23) Disconnect the hoses from the fittings at the steering gear.

(24) Drain the pump reservoir.

(25) Cap the fittings on the hoses and steering gear to prevent foreign objects from entering the system.

**Fig. 5 Air Cleaner Assembly**

- 1 - POWER STEERING PUMP
- 2 - AIR CLEANER ASSEMBLY

## ENGINE - 4.0L (Continued)

- (26) Raise and support the vehicle.
- (27) Disconnect the wires from the engine starter motor solenoid.
- (28) Remove the engine starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (29) Disconnect the oxygen sensor from the exhaust pipe.
- (30) Disconnect the exhaust pipe from the manifold.
- (31) Remove the exhaust pipe support.
- (32) Remove the bending brace (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCT SUPPORT - REMOVAL).
- (33) Remove the engine flywheel/converter housing access cover.
- (34) Mark the converter and drive plate location.
- (35) Remove the converter-to-drive plate bolts.
- (36) Remove the upper engine flywheel/converter housing bolts and loosen the bottom bolts.
- (37) Remove the engine mount cushion-to-engine compartment bracket bolts.
- (38) Lower the vehicle.
- (39) Attach a lifting device to the engine.
- (40) Raise the engine off the front supports.
- (41) Place a support or floor jack under the converter (or engine flywheel) housing.
- (42) Remove the remaining converter (or engine flywheel) housing bolts.
- (43) Lift the engine out of the engine compartment.

## INSTALLATION

**CAUTION:** When installing the engine into a vehicle equipped with an automatic transmission, be careful not to damage the trigger wheel on the engine flywheel.

- (1) Attach a lifting device to the engine and lower the engine into the engine compartment. For easier installation, it may be necessary to remove the engine mount bracket as an aid in alignment of the engine to the transmission.
- (2) Align the transmission torque converter housing with the engine.
- (3) Loosely install the converter housing lower bolts and install the next higher bolt and nut on each side.
- (4) Tighten all 4 bolts finger tight.
- (5) Install the engine mount brackets (if removed).
- (6) Lower the engine and engine mount brackets onto the engine compartment cushions. Install the bolts and finger tighten the nuts.
- (7) Remove the engine lifting device.
- (8) Raise and support the vehicle.

(9) Install the remaining engine flywheel/converter housing bolts. Tighten all bolts to 38 N·m (28 ft. lbs.) torque.

- (10) Install the converter-to-drive plate bolts.
- (11) Ensure the installation reference marks are aligned.
- (12) Install the engine flywheel/converter housing access cover.
- (13) Install the exhaust pipe support and tighten the screw.
- (14) Install the engine bending brace (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCT SUPPORT - INSTALLATION).
- (15) Tighten the engine mount-to-bracket bolts.
- (16) Connect the vehicle speed sensor wire connections and tighten the screws.
- (17) Connect the exhaust pipe to the manifold.
- (18) Install the engine starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).
- (19) Connect the wires to the engine starter motor solenoid.
- (20) Lower the vehicle.
- (21) Connect all the vacuum hoses and wire connectors identified during engine removal.
- (22) Remove protective caps from the power steering hoses.
- (23) Connect the hoses to the fittings at the steering gear. Tighten the nut to 52 N·m (38 ft. lbs.) torque.
- (24) Fill the pump reservoir with fluid.
- (25) Inspect the fuel supply line o-ring(s) and replace if necessary. Connect fuel supply line to injector rail and verify connection by pulling outward on the line.
- (26) Install the fuel line bracket to the intake manifold.
- (27) Connect the coil rail electrical connectors and oil pressure switch connector.
- (28) Connect the following electrical connectors:
  - Power steering pressure switch
  - Coolant temperature sensor
  - Six (6) fuel injector connectors
  - Intake air temperature sensor
  - Throttle position sensor
  - Map sensor
  - Crankshaft position sensor
  - Oxygen sensor
  - Camshaft position sensor
  - Generator connector and B+ terminal wire
- (29) Connect all previously removed vacuum hoses.
- (30) Connect the body ground strap.
- (31) Install the throttle, transmission line pressure, and speed control cables to their mounting bracket and connect them to the throttle body.

## ENGINE - 4.0L (Continued)

(32) Connect the heater hoses at the engine thermostat housing and water pump.

(33) Install the fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(34) Place the fan shroud in position over the fan.

(35) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(36) Connect the service valves to the A/C compressor ports, if equipped with A/C.

(37) Charge the air conditioner system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(38) Connect the radiator hoses and automatic transmission fluid cooler pipes, if equipped.

(39) Install the fan shroud to the radiator or radiator/condenser (if equipped with A/C).

(40) Install upper radiator support.

(41) Connect the upper radiator hose and tighten the clamp.

(42) Connect the lower radiator hose and tighten the clamp.

(43) Fill crankcase with engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID CAPACITIES - SPECIFICATIONS) for correct capacities.

(44) Fill the cooling system with reusable coolant or new coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(45) Align the hood to the scribe marks. Install the hood.

(46) Install the air cleaner assembly.

(47) Install the battery and connect the battery cable.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.**

(48) Start the engine, inspect for leaks and correct the fluid levels, as necessary.

## SPECIFICATIONS

## ENGINE - 4.0L

DESCRIPTION	SPECIFICATION
Engine Type	In-line 6 Cylinder
Bore and Stroke	98.4 x 86.69 mm (3.88 x 3.413 in.)
Displacement	4.0L (242 cu. in.)
Compression Ratio	8.8:1
Firing Order	1-5-3-6-2-4
Lubrication	Pressure Feed-Full Flow Filtration
Cooling System	Liquid Cooled-Forced Circulation
Cylinder Block	Cast Iron
Crankshaft	Cast Nodular Iron
Cylinder Head	Cast Iron
Camshaft	Cast Iron
Pistons	Aluminum Alloy
Combustion Chamber	Dual-Quench
Connecting Rods	Cast Malleable Iron
<b>CAMSHAFT</b>	
Hydraulic Tappet Clearance	Zero Lash
Bearing Clearance	0.025 to 0.076 mm (0.001 to 0.003 in.)
Bearing Journal Diameter	
No. 1	51.54 to 51.56 mm (2.029 to 2.030 in.)
No. 2	51.28 to 51.31 mm (2.019 to 2.020 in.)
No. 3	51.03 to 51.05 mm (2.009 to 2.010 in.)
No. 4	50.78 to 50.80 mm (1.999 to 2.000 in.)
Base Circle Runout (MAX)	0.03 mm

## AIR CLEANER ELEMENT

### REMOVAL - 4.0L

(1) Unlatch four clips retaining air cleaner cover to air cleaner housing (Fig. 6).

80b89901

**Fig. 6 Air Cleaner Assembly —4.0L Engine**

- 1 - RESONATOR BOLTS
- 2 - CLAMPS
- 3 - AIR DUCT
- 4 - AIR CLEANER COVER
- 5 - CLIPS
- 6 - HOUSING
- 7 - HOUSING BOLTS (3)
- 8 - LOWER HOUSING NUTS (3)
- 9 - RESONATOR

- (2) Lift cover up and position to the side.
- (3) Remove air cleaner element.

### INSTALLATION - 4.0L

- (1) Clean inside of air cleaner housing before installing new element.
- (2) Install air cleaner element into housing.
- (3) Latch clips and clamp cover down to secure. Be sure air cleaner cover is properly seated to air cleaner housing.

## AIR CLEANER HOUSING

### REMOVAL - 4.0L

- (1) Disconnect air cleaner cover-to-air duct clamp (Fig. 6).
- (2) Disconnect air duct at housing.
- (3) **Each of the 3 air cleaner housing mounting bolts is attached with 2 nuts (an upper nut and lower nut). DO NOT REMOVE BOLTS. To prevent stripping bolts, only remove lower nuts. The lower housing nuts are located under left front inner fender (Fig. 6).**
  - (a) To gain access to lower nuts, raise vehicle.
  - (b) Remove clips retaining rubber inner fender shield.
  - (c) Pry back shield enough to gain access to lower nuts.
  - (d) Remove 3 nuts.
  - (e) Remove air cleaner assembly from vehicle.
- (4) If resonator is to be removed, disconnect breather tube at resonator, disconnect air duct clamp at resonator (Fig. 6) and remove 1 resonator mounting bolt. Remove resonator from throttle body by loosening clamp (Fig. 7).

80b89903

**Fig. 7 RESONATOR CLAMP - 4.0L**

- 1 - RESONATOR
- 2 - AIR DUCT
- 3 - CLAMP

### INSTALLATION - 4.0L

- (1) Position air cleaner assembly to body and install 3 nuts. Tighten nuts to 10 N·m (93 in. lbs.) torque. **To prevent excessive vibration transmitted through housing, the nuts must be properly torqued. Do not overtighten nuts.**

## AIR CLEANER HOUSING (Continued)

(2) If resonator was removed: Install resonator and bolts. Tighten bolts to 4 N·m (35 in. lbs.) torque. Tighten clamp at throttle body to 4 N·m (35 in. lbs.) torque.

(3) Position fender liner and install clips.

(4) Connect air duct at housing (Fig. 6).

(5) Tighten air duct clamp.

## CYLINDER HEAD

## DESCRIPTION

The cylinder head is made of cast iron containing twelve valves made of chrome plated heat resistant steel, valve stem seals, springs, retainers and keepers. The cylinder head and valve seats can be resurfaced for service purposes.

The valve guides are integral to the cylinder head. They are not replaceable. However, they are serviceable.

The cylinder head uses dual quench-type design combustion chambers which cause turbulence in the cylinders allowing faster burning of the air/fuel mixture, resulting in better fuel economy (Fig. 8).

80a534a1

**Fig. 8 Cylinder Head 4.0L Engine**

- 1 - CYLINDER HEAD BOLTS
- 2 - CYLINDER HEAD GASKET
- 3 - CYLINDER HEAD

## REMOVAL

**NOTE:** This procedure can be done with the engine in or out of the vehicle.

(1) Disconnect the battery negative cable.

**WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.**

(2) Drain the coolant (Refer to 7 - COOLING - STANDARD PROCEDURE) and disconnect the hoses at the engine thermostat housing and the water pump inlet. DO NOT waste reusable coolant. If the solution is clean and is being drained only to service the engine or cooling system, drain the coolant into a clean container for reuse.

(3) Remove the air cleaner assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(4) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(5) Remove the capscrews, bridge and pivot assemblies and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

(6) Remove the push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order as removed.**

(7) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(8) Remove the A/C compressor mounting bolts and secure the compressor to the side.

(9) Remove the power steering pump and bracket from the intake manifold and water pump. Set the pump and bracket aside. DO NOT disconnect the hoses.

(10) Perform the Fuel System Pressure Release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(11) Disconnect the fuel supply line at the fuel rail.

(12) Remove the intake and exhaust manifolds from the engine cylinder head (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(13) Remove the coil rail (Refer to 8 - ELECTRICAL/IGNITION CONTROL/COIL RAIL - REMOVAL).

(14) Remove spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(15) Disconnect the temperature sending unit wire connector.

(16) Remove the engine cylinder head bolts. Bolt No.14 cannot be removed until the head is moved forward (Fig. 9). Pull bolt No.14 out as far as it will go and then suspend the bolt in this position (tape around the bolt).

(17) Remove the engine cylinder head and gasket (Fig. 9).

(18) If this was the first time the bolts were removed, put a paint dab on the top of the bolt. If the bolts have a paint dab on the top of the bolt or it isn't known if they were used before, discard the bolts.

## CYLINDER HEAD (Continued)

(19) Stuff clean lint free shop towels into the cylinder bores.

**NOTE:** If the valves, springs, or seals are to be inspected/replaced at this time, (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE) for proper inspection procedures.

80a534a1

**Fig. 9 Engine Cylinder**

- 1 - CYLINDER HEAD BOLTS  
2 - CYLINDER HEAD GASKET  
3 - CYLINDER HEAD

## CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and engine exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

## INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces.

## INSTALLATION

**NOTE:** This procedure can be done with the engine in or out of the vehicle.

The engine cylinder head gasket is a multi layer steel gasket. The gasket is to be installed DRY. **DO NOT use a gasket sealing compound on the gasket.**

If the engine cylinder head is to be replaced and the original valves used, measure the valve stem diameter. Only standard size valves can be used with a service replacement engine cylinder head unless the replacement head valve stem guide bores are reamed to accommodate oversize valve stems. Remove all carbon buildup and reface the valves.

(1) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.

(2) Position the engine cylinder head gasket (with the numbers facing up) using the alignment dowels in the cylinder block, to position the gasket.

**CAUTION:** Engine cylinder head bolts should be reused only once. Replace the head bolts if they were used before or if they have a paint dab on the top of the bolt.

(3) With bolt No.14 held in place (tape around bolt), install the engine cylinder head over the same dowels used to locate the gasket. Remove the tape from bolt No.14.

(4) Coat the threads of stud bolt No.11 with Loctite 592 sealant, or equivalent.

(5) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 10).

**CAUTION:** During the final tightening sequence, bolt No.11 will be tightened to a lower torque than the rest of the bolts. **DO NOT** overtighten bolt No.11.

(a) Tighten all bolts in sequence (1 through 14) to 30 N·m (22 ft. lbs.) torque.

(b) Tighten all bolts in sequence (1 through 14) to 61 N·m (45 ft. lbs.) torque.

(c) Check all bolts to verify they are set to 61 N·m (45 ft. lbs.) torque.

(d) Tighten bolts in sequence:

- Bolts 1 through 10 to 149 N·m (110 ft. lbs.) torque.
- Bolt 11 to 135 N·m (100 ft. lbs.) torque.
- Bolts 12 through 14 to 149 N·m (110 ft. lbs.) torque.

### CYLINDER HEAD BOLTS

POSITION	DESCRIPTION
1,4,5,12,13	1/2 in.-13 BOLT
8,9	1/2 in.-13 BOLT WITH DOWEL POINT
2,3,6,7,10,11,14	1/2 in.-13 WITH 7/16 in.-14 STUD END
All bolts are 12 point drives for rocker cover clearance	

## CYLINDER HEAD (Continued)

(e) Check all bolts in sequence to verify the correct torque.

(f) If not already done, clean and mark each bolt with a dab of paint after tightening. Should you encounter bolts which were painted in an earlier service operation, replace them.

**Fig. 10 Engine Cylinder Head Bolt Tightening Sequence**

(6) Install the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - INSTALLATION).

(7) Connect the temperature sending unit wire connector.

(8) Install the ignition coil rail (Refer to 8 - ELECTRICAL/IGNITION CONTROL/COIL RAIL - INSTALLATION).

(9) Install the intake and exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(10) Install the fuel line.

(11) Attach the power steering pump and bracket.

(12) Install the push rods, rocker arms, pivots and bridges in the order they were removed (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(13) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(14) Attach the air conditioner compressor mounting bracket to the engine cylinder head and block. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.

(15) Attach the air conditioning compressor to the bracket. Tighten the bolts to 27 N·m (20 ft. lbs.) torque.

**CAUTION:** The serpentine drive belt must be routed correctly. Incorrect routing can cause the water pump to turn in the opposite direction causing the engine to overheat.

(16) Install the serpentine drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(17) Install the air cleaner and ducting.

(18) Connect the hoses to the engine thermostat housing and fill the cooling system to the specified level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(19) The automatic transmission throttle linkage and cable must be adjusted after completing the engine cylinder head installation (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - ADJUSTMENTS).

(20) Install the temperature sending unit and connect the wire connector.

(21) If equipped with air conditioning, install A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION) and charge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(22) Connect negative cable to battery.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.**

(23) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the engine thermostat opens. Add coolant, if required.

## CYLINDER HEAD COVER(S)

## DESCRIPTION

The cylinder head cover (Fig. 11) is made of stamped steel and incorporates the Crankcase Ventilation (CCV) Hoses and the oil fill opening.

80bcea5b

**Fig. 11 Cylinder Head Cover**

## CYLINDER HEAD COVER(S) (Continued)

## REMOVAL

The cylinder head cover is isolated from the cylinder head via grommets and a reusable molded rubber gasket. The grommet and limiter are retained in the cylinder head cover.

- (1) Disconnect negative cable from battery.
- (2) Disconnect the Crankcase Ventilation (CCV) vacuum hose from engine cylinder head cover.
- (3) Disconnect the fresh air inlet hose from the engine cylinder head cover.
- (4) Disconnect the accelerator, transmission, and speed (if equipped) control cables from the throttle body (Fig. 12).
- (5) Remove the three bolts that fasten the control cable bracket to the intake manifold.
- (6) Remove control cables from cylinder head cover clip.
- (7) Position control cables and bracket away from cylinder head cover secure with tie straps.
- (8) Remove the engine cylinder head cover mounting bolts.
- (9) Remove the engine cylinder head cover and gasket.

**Fig. 12 Engine Cylinder Head Cover**

- 1 - TRANS CONTROL CABLE
- 2 - ACCELERATOR CABLE
- 3 - CONTROL CABLE BRACKET
- 4 - CYLINDER HEAD COVER

## CLEANING

Remove any original sealer from the cover sealing surface of the engine cylinder head and clean the surface using a fabric cleaner.

Remove all residue from the sealing surface using a clean, dry cloth.

## INSPECTION

Inspect the engine cylinder head cover for cracks. Replace the cover, if cracked.

The original dark grey gasket material should NOT be removed. If sections of the gasket material are missing or are compressed, replace the engine cylinder head cover. However, sections with minor damage such as small cracks, cuts or chips may be repaired with a hand held applicator. The new material must be smoothed over to maintain gasket height. Allow the gasket material to cure prior to engine cylinder head cover installation.

## INSTALLATION

The cylinder head cover is isolated from the cylinder head via grommets and a reusable molded rubber gasket. The grommet and limiter are retained in the cylinder head cover.

- (1) If a replacement cover is installed, transfer the CCV valve grommet and oil filler cap from the original cover to the replacement cover.
- (2) Install cylinder head cover and gasket (Fig. 13). Tighten the mounting bolts to 10 N·m (85 in. lbs.) torque.

**Fig. 13 Cylinder Head Cover Gasket Locator Pins at #8 & #9**

- (3) Connect the CCV hoses.
- (4) Install control cables and bracket on intake manifold and tighten bolts to 8.7 N·m (77 in. lbs.) torque.
- (5) Connect control cables to throttle body linkage.
- (6) Snap control cables into cylinder head cover clip.
- (7) Connect negative cable to battery.

## INTAKE/EXHAUST VALVES & SEATS

### DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. All valves use three bead locks to promote valve rotation (Fig. 14).

80b7704b

**Fig. 14 VALVE AND KEEPER CONFIGURATION 4.0L**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

### STANDARD PROCEDURE - VALVE SERVICE

#### VALVE REFACING

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.

(2) After refacing, a margin of at least 0.787 mm (0.031 inch) must remain (Fig. 15). If the margin is less than 0.787 mm (0.031 inch), the valve must be replaced.

**Fig. 15 Valve Facing**

- 1 - VALVE MARGIN
- 2 - NO MARGIN

#### VALVE SEAT REFACING

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.

(2) Use tapered stones to obtain the specified seat width when required.

(3) Control valve seat runoff to a maximum of 0.0635 mm (0.0025 in.) (Fig. 16).

**Fig. 16 Measurement of Valve Seat Runout**

- 1 - DIAL INDICATOR

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

## VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

## PREFERRED METHOD

- (1) Remove the valve from the head.
- (2) Clean the valve stem guide bore with solvent and a bristle brush.
- (3) Insert a telescoping gauge into the valve stem guide bore approximately 9.525 mm (.375 inch) from the valve spring side of the head (Fig. 17).

J9509-87

**Fig. 17 Measurement of Valve Guide Bore Diameter**

- 1 - GAUGE
- 2 - 9.525 MM (3/8 INCH)
- 3 - VALVE STEM GUIDE
- 4 - CYLINDER HEAD

(4) Remove and measure telescoping gauge with a micrometer.

(5) Repeat the measurement with contacts lengthwise to engine cylinder head.

(6) Compare the crosswise to lengthwise measurements to determine out-of-roundness. If the measurements differ by more than 0.0635 mm (0.0025 in.), ream the guide bore to accommodate an oversize valve stem.

(7) Compare the measured valve guide bore diameter with specifications (7.95-7.97 mm or 0.313-0.314 inch). If the measurement differs from specification by more than 0.076 mm (0.003 inch), ream the guide bore to accommodate an oversize valve stem.

## ALTERNATIVE METHOD

(1) Use a dial indicator to measure the lateral movement of the valve stem (stem-to-guide clearance). This must be done with the valve installed in its guide and just off the valve seat (Fig. 18).

(2) Correct clearance is 0.025-0.0762 mm (0.001-0.003 inch). If indicated movement exceeds the specification ream the valve guide to accommodate an oversize valve stem.

**NOTE:** Valve seats must be ground after reaming the valve guides to ensure that the valve seat is concentric to the valve guide.

J9009-16

**Fig. 18 Measurement of Lateral Movement Of Valve Stem**

- 1 - DIAL INDICATOR

## REMOVAL

**NOTE:** This procedure is done with the engine cylinder head removed from the block.

(1) Remove the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) from the cylinder block.

(2) Use Valve Spring Compressor Tool MD-998772A and compress each valve spring.

(3) Remove the valve locks, retainers, springs and valve stem oil seals. Discard the oil seals (Fig. 19).

(4) Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(5) Remove the valves, and place them in a rack in the same order as removed.

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

**Fig. 19 Valve and Valve Components**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

**INSTALLATION**

**NOTE:** This procedure is done with the engine cylinder head removed from the block.

- (1) Thoroughly clean the valve stems and the valve guide bores.
- (2) Lightly lubricate the stem.
- (3) Install the valve in the original valve guide bore.
- (4) Install the replacement valve stem oil seals on the valve stems (Fig. 20). If the 0.381 mm (0.015 inch) oversize valve stems are used, oversize oil seals are required.

(5) Position the valve spring and retainer on the engine cylinder head and compress the valve spring with Valve Spring Compressor Tool MD-998772A.

(6) Install the valve locks and release the tool.

(7) Tap the valve spring from side to side with a hammer to ensure that the spring is properly seated at the engine cylinder head. Also tap the top of the retainer to seat the valve locks.

(8) Install the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

**Fig. 20 Valve and Valve Components**

## ROCKER ARM / ADJUSTER ASSEMBLY

### DESCRIPTION

The rocker arms are made of stamped steel and have a operational ratio of 1.6:1 (Fig. 21).

J8909-8

**Fig. 21 Rocker Arms—Typical**

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

### OPERATION

When the push rods are forced upward by the camshaft lobes the push rod presses upward on the rocker arms, the rocker arms pivot, forcing downward pressure on the valves forcing the valves to move downward and off from their seats.

### REMOVAL

**NOTE:** This procedure can be done with the engine in or out of the vehicle.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Check for rocker arm bridges which are causing misalignment of the rocker arm to valve tip area.

(3) Remove the cap screws at each bridge and pivot assembly (Fig. 22). Alternately loosen the cap screws one turn at a time to avoid damaging the bridges.

(4) Remove the bridges, pivots and corresponding pairs of rocker arms (Fig. 22). Place them on a bench in the same order as removed.

(5) Remove the push rods and place them on a bench in the same order as removed.

J8909-8

**Fig. 22 Rocker Arm**

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

### CLEANING

Clean all the components with cleaning solvent.

Use compressed air to blow out the oil passages in the rocker arms and push rods.

### INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.

Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.

Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.

Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.

A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.

## ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

## INSTALLATION

**NOTE:** This procedure can be done with the engine in or out of the vehicle.

(1) Lubricate the ball ends of the push rods with Mopar® Engine Oil Supplement, or equivalent and install push rods in their original locations. Ensure that the bottom end of each push rod is centered in the tappet plunger cap seat.

(2) Using Mopar® Engine Oil Supplement, or equivalent, lubricate the area of the rocker arm that the pivot contacts. Install rocker arms, pivots and bridge above each cylinder in their originally position (Fig. 23).

(3) Loosely install the capscrews through each bridge.

(4) At each bridge, tighten the capscrews alternately, one turn at a time, to avoid damaging the bridge. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(5) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

**Fig. 23 Rocker Arm**

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

## VALVE STEM SEALS

## DESCRIPTION

The valve stem seals (Fig. 24) are made of rubber and incorporate a garter spring to maintain consistent lubrication control.

80b7704b

**Fig. 24 Valve**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

## VALVE SPRINGS

## DESCRIPTION

The valve springs (Fig. 25) are made of high strength silicon chrome spring steel. The springs are common for both intake and exhaust valves.

## STANDARD PROCEDURE - VALVE SPRING TENSION TEST

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

Use a universal Valve Spring Tester and a torque wrench to test each valve spring for the specified tension value (Fig. 26).

Replace valve springs that are not within specifications.

## VALVE SPRINGS (Continued)

80b7704b

- 6 - VALVE SPRING

9509-79

**Fig. 26 Valve Spring Tester**

- 1 - TORQUE WRENCH
- 2 - VALVE SPRING TESTER

**REMOVAL**

**NOTE:** This procedure can be done with the engine cylinder head installed on the block.

Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.

(1) Remove the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove cap screws, bridge and pivot assemblies and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL) for access to each valve spring to be removed.

(3) Remove push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order and position as removed.**

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Remove the spark plug(s) adjacent to the cylinder(s) below the valve springs to be removed.

(6) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats. For vehicles equipped with an air conditioner, use a flexible air adaptor when servicing the No.1 cylinder.

(7) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool MD-998772A to compress the spring and remove the locks (Fig. 27).

(8) Remove valve spring and retainer (Fig. 27).

(9) Remove valve stem oil seals (Fig. 27). Note the valve seals are different for intake and exhaust valves. The top of each seal is marked either INT (intake/black in color) or EXH (exhaust/brown in color). DO NOT mix the seals.

**INSTALLATION**

**NOTE:** This procedure can be done with the engine cylinder head installed on the block.

**CAUTION:** Install oil seals carefully to prevent damage from the sharp edges of the valve spring lock groove.

(1) Lightly push the valve seal over the valve stem and valve guide boss. Be sure the seal is completely seated on the valve guide boss.

(2) Install valve spring and retainer (Fig. 28).

(3) Compress the valve spring with Valve Spring Compressor Tool MD-998772A and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that the spring is seated properly on the engine cylinder head.

## VALVE SPRINGS (Continued)

80b7704b

**Fig. 27 Valve and Valve Components**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

(4) Release air pressure and disconnect the air hose. Remove the adaptor from the spark plug hole and install the spark plug.

(5) Repeat the procedures for each remaining valve spring to be removed.

(6) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

(7) Install the rocker arms, pivots and bridge (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION) at their original location.

(8) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## ENGINE BLOCK

## CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

## INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter (Fig. 29). To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

## ENGINE BLOCK (Continued)

**Fig. 29 Cylinder Bore Measurement**

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder must be bored and then honed to accept an oversize piston. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

## CAMSHAFT & BEARINGS

### DESCRIPTION

The camshaft is made of gray cast iron with twelve machined lobes and four bearing journals (Fig. 30). When the camshaft rotates the lobes actuate the tappets and push rods, forcing upward on the rocker arms which applies downward force on the valves.

### REMOVAL

#### REMOVAL - CAMSHAFT BEARINGS

The camshaft rotates within four steel-shelled, babbitt-lined bearings that are pressed into the cylinder block and then line reamed. The camshaft bearing bores and bearing diameters are not the same size. They are stepped down in 0.254 mm (0.010 inch) increments from the front bearing (largest) to the rear bearing (smallest). This permits easier removal and installation of the camshaft. The

**Fig. 30 Camshaft—Typical**

- 1 - CAMSHAFT
- 2 - LOBES
- 3 - BEARING JOURNAL

camshaft bearings are pressure lubricated. Camshaft end play is maintained by the thrust plate.

(1) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

**NOTE:** It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

(2) Using Special tool 8544 Camshaft Bushing Remover Installer, remove the camshaft bearings.

### REMOVAL - CAMSHAFT

**WARNING:** THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. RELEASE THE PRESSURE BEFORE REMOVING THE DRAIN COCK, CAP AND DRAIN PLUGS.

- (1) Disconnect negative cable from battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL) and condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL), if equipped with A/C.

## CAMSHAFT &amp; BEARINGS (Continued)

(4) Remove the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(5) Remove the rocker arms, bridges and pivots (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

(6) Remove the push rods.

(7) Remove the engine cylinder head and gasket (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(8) Remove the hydraulic valve tappets from the engine cylinder block (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - REMOVAL).

(9) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(10) Remove the timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(11) Rotate the crankshaft until the crankshaft sprocket timing mark is aligned on centerline with the camshaft sprocket timing mark (Fig. 32).

(12) Remove the timing chain and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/ CHAIN AND SPROCKETS - REMOVAL).

(13) Remove the front bumper and/or grille, as required.

(14) Remove the two thrust plate retaining screws, thrust plate and camshaft (Fig. 31).

80bfe168

**Fig. 31 Camshaft Removal**

- 1 - CAMSHAFT
- 2 - CRANKSHAFT

80bfe0fa

**Fig. 32 Crankshaft / Camshaft Sprocket Timing Mark Alignment**

- 3 - CRANKSHAFT SPROCKET

## INSPECTION

## INSPECTION - CAMSHAFT BEARINGS

(1) Inspect the bearing journals for uneven wear pattern or finish.

(2) Inspect the bearings for wear.

## INSPECTION - CAMSHAFT

(1) Inspect the cam lobes for wear.

(2) Inspect the camshaft position sensor drive gear for wear.

(3) If the camshaft appears to have been rubbing against the thrust washer, examine the oil pressure relief holes in the rear cam journal. The oil pressure relief holes must be free of debris.

## INSTALLATION

## INSTALLATION - CAMSHAFT BEARINGS

**CAUTION:** Make sure outside diameter of number 1 bearing is clean. Make sure that the bearing is properly installed in the engine block, align the oil hole in the bearing with the oil gallery in the bearing bore. Failure to do so will cause inadequate oil supply for the sprockets and timing chain.

## CAMSHAFT &amp; BEARINGS (Continued)

(1) Using recommended special tool 8544 Camshaft Bearing Remover/Installer, install new camshaft bearings.

**INSTALLATION - CAMSHAFT**

(1) Lubricate the camshaft with Mopar® Engine Oil Supplement, or equivalent.

(2) Carefully install the camshaft to prevent damage to the camshaft bearings.

(3) Position thrust plate and install retaining screws. Tighten screws to 24 N·m (18 ft. lbs.).

(4) Lubricate the camshaft with Mopar® engine oil supplement, or equivalent.

(5) Install the camshaft sprocket, crankshaft sprocket and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Tighten the camshaft sprocket bolt and washer to 68 N·m (50 ft. lbs.).

(7) To verify correct installation of the timing chain, turn the crankshaft two full revolutions then position the camshaft sprocket timing mark as shown in (Fig. 33).

80bfe0fa

**Fig. 33 Crankshaft / Camshaft Chain Drive Installation—Typical**

- 1 - CAMSHAFT SPROCKET
- 2 - TIMING MARKS
- 3 - CRANKSHAFT SPROCKET

(8) Install the timing case cover with a replacement oil seal (Fig. 34). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(9) Install the vibration damper (Fig. 34) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

80abd2b1

**Fig. 34 Timing Case Cover Components**

- 1 - TIMING CASE COVER
- 2 - OIL SLINGER
- 3 - CRANKSHAFT OIL SEAL
- 4 - VIBRATION DAMPER PULLEY

(10) Install the hydraulic valve tappets (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).

(11) Install the cylinder head gasket with the numbers facing up.

(12) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(13) Install the push rods.

(14) Install the rocker arms and pivot and bridge assemblies (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(15) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(16) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

**NOTE:** During installation, lubricate the hydraulic valve tappets and all valve components with Mopar® Engine Oil Supplement, or equivalent. The Mopar® Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(17) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(18) Check the ignition timing and adjust as necessary.

(19) Install the grille and bumper, if removed.

(20) Connect negative cable to battery.

## CONNECTING ROD BEARINGS

### STANDARD PROCEDURE - FITTING CONNECTING ROD BEARINGS

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 35) (Fig. 36). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 37). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

J8909-127

**Fig. 35 Connecting Rod Bearing Inspection**

- 1 - UPPER BEARING HALF
- 2 - MATING EDGES
- 3 - GROOVES CAUSED BY ROD BOLTS SCRATCHING JOURNAL DURING INSTALLATION
- 4 - WEAR PATTERN - ALWAYS GREATER ON UPPER BEARING
- 5 - LOWER BEARING HALF

J8909-128

**Fig. 36 Locking Tab Inspection**

- 1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

J8909-129

**Fig. 37 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal**

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

### BEARING-TO-JOURNAL CLEARANCE

- (1) Wipe the oil from the connecting rod journal.
- (2) Use short rubber hose sections over rod bolts during installation.
- (3) Lubricate the upper bearing insert and install in connecting rod.
- (4) Use piston ring compressor to install the rod and piston assemblies. The oil squirt holes in the rods must face the camshaft. The arrow on the piston crown should point to the front of the engine (Fig. 38). Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

J9009-41

**Fig. 38 Rod and Piston Assembly Installation**

## CONNECTING ROD BEARINGS (Continued)

(5) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

(6) Install bearing cap and connecting rod on the journal and tighten nuts to 45 N·m (33 ft. lbs.) torque. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

(7) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 39). **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

(8) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(9) If bearing-to-journal clearance exceeds the specification, install a pair of 0.0254 mm (0.001 inch) undersize bearing inserts. All the odd size inserts must be on the bottom. The sizes of the service replacement bearing inserts are stamped on the backs of the inserts. Measure the clearance as described in the previous steps.

J9009-42

**Fig. 39 Measuring Bearing Clearance with Plastigage**

- 1 - PLASTIGAGE SCALE  
2 - COMPRESSED PLASTIGAGE

(10) The clearance is measured with a pair of 0.0254 mm (0.001 inch) undersize bearing inserts installed. This will determine if two 0.0254 mm (0.001 inch) undersize inserts or another combination is needed to provide the correct clearance. Refer to CONNECTING ROD BEARING FITTING CHART.

## CONNECTING ROD BEARING FITTING CHART

CRANKSHAFT JOURNAL		CORRESPONDING ROD BEARING INSERT	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	53.2257 - 53.2079 mm (2.0955 - 2.0948 in.)	Yellow - Standard	Yellow - Standard
Orange	53.2079 - 53.1901 mm (2.0948 - 2.0941 in.) 0.0178 mm (0.0007 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)
Blue	53.1901 - 53.1724 mm (2.0941 - 2.0934 in.) 0.0356 mm (0.0014 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Blue - Undersize 0.025 mm (0.001 in.)
Red	52.9717 - 52.9539 mm (2.0855 - 2.0848 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

## CONNECTING ROD BEARINGS (Continued)

(11) **FOR EXAMPLE:** If the initial clearance was 0.0762 mm (0.003 inch), 0.025 mm (0.001 inch) undersize inserts would reduce the clearance by 0.025 mm (0.001 inch). The clearance would be 0.002 inch and within specification. A 0.051 mm (0.002 inch) undersize insert would reduce the initial clearance an additional 0.013 mm (0.0005 inch). The clearance would then be 0.038 mm (0.0015 inch).

(12) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(13) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 45 N·m (33 ft. lbs.) torque.

## SIDE CLEARANCE MEASUREMENT

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 40). (Refer to 9 - ENGINE - SPECIFICATIONS). Replace the connecting rod if the side clearance is not within specification.

**Fig. 40 Checking Connecting Rod Side Clearance - Typical**

## CRANKSHAFT

## DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a crossshaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by seven select main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The select fit main bearing markings are located on the crankshaft counter weights. The crankshaft rear oil seal is a two piece design. The front oil seal is a one piece design retained in the timing chain cover (Fig. 41).

80ba7a6b

**Fig. 41 Crankshaft with Select Fit Marking Location**

1 - 1/4" LETTERS

2 - (ROD)

3 - (MAIN)

## CRANKSHAFT MAIN BEARINGS

## STANDARD PROCEDURE - FITTING CRANKSHAFT MAIN BEARINGS

## FITTING BEARINGS (CRANKSHAFT INSTALLED)

The main bearing caps, numbered (front to rear) from 1 through 7 have an arrow to indicate the forward position. The upper main bearing inserts are grooved to provide oil channels while the lower inserts are smooth.

Each bearing insert pair is selectively fitted to its respective journal to obtain the specified operating clearance. In production, the select fit is obtained by using various-sized color-coded bearing insert pairs as listed in the Main Bearing Fitting Chart. The bearing color code appears on the edge of the insert. **The size is not stamped on bearing inserts used for engine production.**

The main bearing journal size (diameter) is identified by a color-coded paint mark (Fig. 42) on the adjacent cheek or counterweight towards the rear of the crankshaft (flange end). The rear main journal, is identified by a color-coded paint mark on the crankshaft rear flange.

When required, upper and lower bearing inserts of different sizes may be used as a pair. A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce the clearance by 0.013 mm (0.0005 inch). **Never use a pair of bearing inserts with greater than a 0.025 mm (0.001 inch) difference in size. Refer to the Bearing Insert Pair Chart.**

**NOTE:** When replacing inserts, the odd size inserts must be either all on the top (in cylinder block) or all on the bottom (in main bearing cap).

## CRANKSHAFT MAIN BEARINGS (Continued)

4 - NO. 1 MAIN JOURNAL SIZE PAINT MARK

Once the bearings have been properly fitted, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - INSTALLATION).

**BEARING-TO-JOURNAL CLEARANCE (CRANKSHAFT INSTALLED)**

When using Plastigage, check only one bearing clearance at a time.

Install the grooved main bearings into the cylinder block and the non-grooved bearings into the bearing caps.

Install the crankshaft into the upper bearings dry.

Place a strip of Plastigage across full width of the crankshaft journal to be checked.

Install the bearing cap and tighten the bolts to 108 N·m (80 ft. lbs.) torque.

**NOTE: DO NOT rotate the crankshaft. This will cause the Plastigage to shift, resulting in an inaccurate reading. Plastigage must not be permitted to crumble. If brittle, obtain fresh stock.**

Remove the bearing cap. Determine the amount of clearance by measuring the width of the compressed Plastigage with the scale on the Plastigage envelope (Fig. 43). (Refer to 9 - ENGINE - SPECIFICATIONS) for the proper clearance.

Plastigage should indicate the same clearance across the entire width of the insert. If clearance varies, it may indicate a tapered journal or foreign material trapped behind the insert.

J9009-42

**Fig. 43 Measuring Bearing Clearance with Plastigage**

1 - PLASTIGAGE SCALE

2 - COMPRESSED PLASTIGAGE

If the specified clearance is indicated and there are no abnormal wear patterns, replacement of the bearing inserts is not necessary. Remove the Plastigage from the crankshaft journal and bearing insert. Proceed to (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - INSTALLATION).

If the clearance exceeds specification, install a pair of 0.025 mm (0.001 inch) undersize bearing inserts and measure the clearance as described in the previous steps.

## CRANKSHAFT MAIN BEARINGS (Continued)

The clearance indicate with the 0.025 mm (0.001 inch) undersize insert pair installed will determine if this insert size or some other combination will provide the specified clearance. **FOR EXAMPLE:** If the clearance was 0.0762 mm (0.003 inch) originally, a pair of 0.0254 mm (0.001 inch) undersize inserts would reduce the clearance by 0.0254 mm (0.001 inch). The clearance would then be 0.0508 mm (0.002 inch) and within the specification. A 0.051 mm (0.002 inch) undersize bearing insert and a 0.0254 mm (0.001 inch) undersize insert would reduce the original clearance an additional 0.0127 mm (0.0005 inch). The clearance would then be 0.0381 mm (0.0015 inch).

**CAUTION:** Never use a pair of inserts that differ more than one bearing size as a pair.

**FOR EXAMPLE:** DO NOT use a standard size upper insert and a 0.051 mm (0.002 inch) undersize lower insert.

If the clearance exceeds specification using a pair of 0.051 mm (0.002 inch) undersize bearing inserts, measure crankshaft journal diameter with a micrometer. If the journal diameter is correct, the crankshaft bore in the cylinder block may be misaligned, which requires cylinder block replacement or machining to true bore.

Replace the crankshaft or grind to accept the appropriate undersize bearing inserts if:

- Journal diameters 1 through 6 are less than 63.4517 mm (2.4981 inches)
- Journal 7 diameter is less than 63.4365 mm (2.4975 inches).

Once the proper clearances have been obtained, proceed to (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - INSTALLATION).

**JOURNAL DIAMETER (CRANKSHAFT REMOVED)**

Remove the crankshaft from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper and out of round is 0.013 mm (0.0005 inch). Compare the measured diameter with the journal diameter specification MAIN BEARING FITTING CHART. Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block.

MAIN BEARING FITTING CHART

Crankshaft Journals #1-6		Corresponding Crankshaft Bearing Insert	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	63.5025 - 63.4898 mm (2.5001 - 2.4996 in.)	Yellow - Standard	Yellow - Standard
Orange	63.4898 - 63.4771 mm (2.4996 - 2.4991 in.) 0.0127 mm (0.0005 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)
Blue	63.4771 - 63.4644 mm (2.4991 - 2.4986 in.) 0.0254 mm (0.001 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Blue - Undersize 0.025 mm (0.001 in.)
Green	63.4644 - 63.4517 mm (2.4986 - 2.4981 in.) 0.0381 mm (0.0015 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Green - Undersize 0.051 mm (0.002 in.)
Red	63.2485 - 63.2358 mm (2.4901 - 2.4896 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

## CRANKSHAFT MAIN BEARINGS (Continued)

Crankshaft Journal #7 Only		Corresponding Bearing Insert	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	63.4873 - 63.4746 mm (2.4995 - 2.4990 in.)	Yellow - Standard	Yellow - Standard
Orange	63.4746 - 63.4619 mm (2.4990 - 2.4985 in.) 0.0127 mm (0.0005 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)

## REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).
- (3) Raise the vehicle.

(4) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL) and oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(5) Remove main bearing cap brace (Fig. 44).

**Fig. 44 Main Bearing Caps and Brace.**

- 1 - BLOCK  
2 - MAIN BEARING CAP BRACE

(6) Remove only one main bearing cap and lower insert at a time (Fig. 45).

(7) Remove the lower insert from the bearing cap.

(8) Remove the upper insert by LOOSENING (DO NOT REMOVE) all of the other bearing caps. Now insert a small cotter pin tool in the crankshaft journal oil hole. Bend the cotter pin as illustrated to fabricate the tool (Fig. 46). With the cotter pin tool in place, rotate the crankshaft so that the upper bearing insert will rotate in the direction of its locking tab. Because there is no hole in the No.3 main journal, use a tongue depressor or similar soft-faced tool to remove the bearing insert (Fig. 46). After moving the insert approximately 25 mm (1 inch), it can be removed by applying pressure under the tab.

(9) Using the same procedure described above, remove the remaining bearing inserts one at a time for inspection.

## INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 47). In general the lower bearing half will have a heavier wear pattern.

## CRANKSHAFT MAIN BEARINGS (Continued)

80a534e3

**Fig. 45 Removing Main Bearing Caps and Lower Inserts**

- 1 - CONNECTING ROD JOURNAL  
2 - MAIN BEARING CAPS

80a534e4

**Fig. 46 Removing Upper Inserts**

- 1 - COTTER PIN  
2 - BEARING INSERT  
3 - TONGUE DEPRESSOR

**NOTE:** If any of the crankshaft journals are scored, remove the engine for crankshaft repair.

**Fig. 47 Main Bearing Wear Patterns**

- 1 - UPPER INSERT  
2 - NO WEAR IN THIS AREA  
3 - LOW AREA IN BEARING LINING  
4 - LOWER INSERT

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

## INSTALLATION

(1) Lubricate the bearing surface of each insert with engine oil.

(2) Loosen all the main bearing caps. Install the main bearing upper inserts.

(3) Install the lower bearing inserts into the main bearing caps.

(4) On the rear main cap, apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 48). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(5) Apply Mopar® Gasket Maker on the rear bearing cap. The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

(6) Install the main bearing cap(s) and lower insert(s).

(7) Tighten the bolts of caps 1, 2, 4, 5, 6, and 7 to 54 N·m (40 ft. lbs.) torque. Now tighten these bolts to 95 N·m (70 ft. lbs.) torque. Finally, tighten these bolts to 108 N·m (80 ft. lbs.) torque.

(8) Push the crankshaft forward and backward. Load the crankshaft front or rear and tighten cap bolt No.3 to 54 N·m (40 ft. lbs.) torque. Then tighten to 95 N·m (70 ft. lbs.) torque and finally tighten to 108 N·m (80 ft. lbs.) torque.

(9) Rotate the crankshaft after tightening each main bearing cap to ensure the crankshaft rotates freely.

## CRANKSHAFT MAIN BEARINGS (Continued)

**Fig. 48 Location of Sealer**

- 1 - DOWEL
- 2 - SEALER LOCATIONS
- 3 - CYLINDER BLOCK
- 4 - HALFWAY BETWEEN
- 5 - REAR FACE OF CYLINDER BLOCK
- 6 - 3mm (0.125 in.)

(10) Check crankshaft end play. Crankshaft end play is controlled by the thrust bearing which is flange and installed at the No.2 main bearing position.

(a) Attach a magnetic base dial indicator to the cylinder block at either the front or rear of the engine.

(b) Position the dial indicator rod so that it is parallel to the center line of the crankshaft.

(c) Pry the crankshaft forward, position the dial indicator to zero.

(d) Pry the crankshaft forward and backward. Note the dial indicator readings. End play is the difference between the high and low measurements (Fig. 49). Correct end play is 0.038-0.165 mm (0.0015-0.0065 inch). The desired specifications are 0.051-0.064 mm (0.002-0.0025 inch).

(e) If end play is not within specification, inspect crankshaft thrust faces for wear. If no wear is apparent, replace the thrust bearing and measure end play. If end play is still not within specification, replace the crankshaft.

(11) If the crankshaft was removed, install the crankshaft into the cylinder block.

(12) Install main bearing cap brace tighten nuts to 47 N·m (35 ft. lbs.) torque.

**Fig. 49 Crankshaft End Play Measurement**

- 1 - DIAL INDICATOR
- 2 - CRANKSHAFT

(13) Install oil pump assy. and tighten attaching bolts to 23 N·m (17 ft. lbs.)

(14) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(15) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(16) Lower the vehicle.

(17) Install the spark plugs. Tighten the plugs to 37 N·m (27 ft. lbs.) torque.

(18) Fill the oil pan with engine oil to the full mark on the dipstick level.

(19) Connect negative cable to battery.

## CRANKSHAFT OIL SEAL - FRONT

### REMOVAL

This procedure is done with the timing case cover installed.

(1) Disconnect negative cable from battery.

(2) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(4) Remove the radiator shroud.

(5) Carefully remove the oil seal. Make sure seal bore is clean.

## CRANKSHAFT OIL SEAL - FRONT (Continued)

## INSTALLATION

This procedure is done with the timing case cover installed.

(1) Position the replacement oil seal on Timing Case Cover Alignment and Seal Installation Tool 6139 with seal open end facing inward. Apply a light film of Perfect Seal, or equivalent, on the outside diameter of the seal. Lightly coat the crankshaft with engine oil.

(2) Position the tool and seal over the end of the crankshaft and insert a draw screw tool into Seal Installation Tool 6139 (Fig. 50). Tighten the nut against the tool until it contacts the cover.

**Fig. 50 Timing Case Cover Oil Seal Installation**

- 1 - SEAL INSTALLATION TOOL  
2 - DRAW SCREW TOOL

(3) Remove the tools. Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(4) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(5) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Install the radiator shroud.

(7) Connect negative cable to battery.

## CRANKSHAFT OIL SEAL - REAR

## REMOVAL

The crankshaft rear main bearing oil seal consists of two half pieces of viton with a single lip that effectively seals the rear of the crankshaft. Replace the upper and lower seal halves as a unit to ensure leak-free operation.

(1) Remove transmission inspection cover.

(2) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(3) Remove main bearing cap brace.

(4) Remove rear main bearing cap (No.7).

(5) Push upper seal out of the groove. Ensure that the crankshaft and seal groove are not damaged.

(6) Remove lower half of the seal from the bearing cap.

## INSTALLATION

The crankshaft rear main bearing oil seal consists of two half pieces of viton with a single lip that effectively seals the rear of the crankshaft. Replace the upper and lower seal halves as a unit to ensure leak-free operation.

(1) Wipe the seal surface area of the crankshaft until it is clean.

(2) Apply a thin coat of engine oil.

(3) Coat lip of the seal with engine oil.

(4) Carefully position the upper seal into the groove in the cylinder block. The lip of the seal faces toward the front of the engine.

(5) Apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 51). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(6) Apply Mopar® Gasket Maker on the rear bearing cap (Fig. 51). The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

(7) Position the lower seal into the bearing cap recess and seat it firmly. Be sure the seal is flush with the cylinder block pan rail.

(8) Coat the outer curved surface of the lower seal with soap and the lip of the seal with engine oil.

(9) Install the rear main bearing cap. DO NOT strike the cap more than twice for proper engagement.

(10) Tighten all main bearing bolts to 108 N·m (80 ft. lbs.) torque.

(11) Install the main bearing cap brace. Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan gasket and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

## CRANKSHAFT OIL SEAL - REAR (Continued)

## HYDRAULIC LIFTERS

## DESCRIPTION

Valve lash is controlled by hydraulic tappets located inside the cylinder block, in tappet bores above the camshaft.

## REMOVAL

**NOTE:** Retain all the components in the same order as removed.

(1) Remove the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Remove the push rods.

(3) Remove the tappets through the push rod openings in the cylinder block with a Hydraulic Valve Tappet Removal/Installation Tool (Fig. 53).

30a534a2

**Fig. 53 HYDRAULIC VALVE TAPPET REMOVAL - 4.0L**

- 1 - HYDRAULIC TAPPET REMOVAL TOOL
- 2 - CYLINDER BLOCK

## CLEANING

Clean each tappet assembly in cleaning solvent to remove all varnish, gum and sludge deposits.

## INSPECTION

Inspect for indications of scuffing on the side and base of each tappet body.

Inspect each tappet base for concave wear with a straightedge positioned across the base. If the base is concave, the corresponding lobe on the camshaft is also worn. Replace the camshaft and tappets.

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 54).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

## HYDRAULIC LIFTERS (Continued)

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

**Fig. 54 Leak-Down Tester**

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

## INSTALLATION

Retain all the components in the same order as removed.

It is not necessary to charge the tappets with engine oil. They will charge themselves within a very short period of engine operation.

(1) Dip each tappet in Mopar® Engine Oil Supplement, or equivalent.

(2) Use Hydraulic Valve Tappet Removal/Installation Tool to install each tappet in the same bore from where it was originally removed.

(3) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(4) Install the push rods in their original locations.

(5) Install the rocker arms and bridge and pivot assemblies at their original locations. Loosely install the capscrews at each bridge.

(6) Tighten the capscrews alternately, one turn at a time, to avoid damaging the bridges. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(7) Pour the remaining Mopar® Engine Oil Supplement, or equivalent over the entire valve actuating assembly. The Mopar® Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1 609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(8) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## PISTON & CONNECTING ROD

### DESCRIPTION

The pistons (Fig. 55) are made of a high strength aluminum alloy, the piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The connecting rods are made of cast iron.

80bcea5c

**Fig. 55 Piston and Connecting Rod Assembly**

## PISTON &amp; CONNECTING ROD (Continued)

## STANDARD PROCEDURE - PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 49.5 mm (1-15/16 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 57).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. **The coated piston connecting rod assembly can be used to service previous built engines and MUST be replaced as complete sets.** Tin coated pistons should not be used as replacements for coated pistons.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 56). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

Fig. 57 Bore Gauge

- 1 - FRONT  
2 - BORE GAUGE  
3 - CYLINDER BORE  
4 - 49.5 MM (1-15/16 in.)

## REMOVAL

(1) Remove the engine cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove the rocker arms, bridges and pivots.

(3) Remove the push rods.

(4) Remove the engine cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(5) Position the pistons one at a time near the bottom of the stroke. Use a ridge reamer to remove the ridge from the top end of the cylinder walls. Use a protective cloth to collect the cuttings.

(6) Raise the vehicle.

## PISTON &amp; CONNECTING ROD (Continued)

- (7) Drain the engine oil.
- (8) Remove the oil pan and gasket. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (9) Remove main bearing cap brace (Fig. 58).

**Fig. 58 Main Bearings Caps and Brace**

- 1 - BLOCK
- 2 - MAIN BEARING CAP BRACE

- (10) Remove the connecting rod bearing caps and inserts. Mark the caps and rods with the cylinder bore location. The connecting rods and caps are stamped with a two letter combination (Fig. 59).

**Fig. 59 Stamped Connecting Rods and Caps**

- 1 - CONNECTING ROD CAP
- 2 - CONNECTING ROD

- (11) Lower the vehicle until it is about 2 feet from the floor.

**CAUTION:** Ensure that the connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose, slipped over the rod bolts will provide protection during removal.

- (12) Have an assistant push the piston and connecting rod assemblies up and through the top of the cylinder bores (Fig. 60).

J9509-84

**Fig. 60 Removal of Connecting Rod and Piston Assembly**

- 1 - PISTON
- 2 - CONNECTING ROD
- 3 - BLOCK

**INSTALLATION**

- (1) Clean the cylinder bores thoroughly. Apply a light film of clean engine oil to the bores with a clean lint-free cloth.

- (2) Install the piston rings on the pistons if removed (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).

- (3) Lubricate the piston and rings with clean engine oil.

**CAUTION:** Ensure that connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose slipped over the connecting rod bolts will provide protection during installation.

## PISTON & CONNECTING ROD (Continued)

(4) Use a piston ring compressor to install the connecting rod and piston assemblies through the top of the cylinder bores (Fig. 61).

(5) Ensure the arrow on the piston top points to the front of the engine (Fig. 61).

J9009-41

**Fig. 61 Rod and Piston Assembly Installation**

(6) Raise the vehicle.

(7) Each bearing insert is fitted to its respective journal to obtain the specified clearance between the bearing and the journal. In production, the select fit is obtained by using various-sized, color-coded bearing inserts as listed in the Connecting Rod Bearing Fitting Chart. The color code appears on the edge of the bearing insert. The size is not stamped on inserts used for production of engines.

(8) The rod journal is identified during the engine production by a color-coded paint mark on the adjacent cheek or counterweight toward the flange (rear) end of the crankshaft. The color codes used to indicate journal sizes are listed in the Connecting Rod Bearing Fitting Chart.

(9) When required, upper and lower bearing inserts of different sizes may be used as a pair (refer to Connecting Rod Bearing Fitting Chart). A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce clearance 0.013 mm (0.0005 inch).

**CAUTION:** DO NOT intermix bearing caps. Each connecting rod and bearing cap are stamped with the cylinder number. The stamp is located on a machined surface adjacent to the oil squirt hole that faces the camshaft side of the cylinder block.

(10) Install the connecting rod bearing caps and inserts in the same positions as removed.

**CAUTION:** Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

(11) Install main bearing cap brace (Fig. 58). Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan and gasket (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Lower the vehicle.

(14) Install the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION), push rods, rocker arms, bridges, pivots and engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Fill the crankcase with engine oil.

## PISTON RINGS

### STANDARD PROCEDURE - PISTON RING FITTING

(1) Carefully clean the carbon from all ring grooves. Oil drain openings in the oil ring groove and pin boss must be clear. DO NOT remove metal from the grooves or lands. This will change ring-to-groove clearances and will damage the ring-to-land seating.

(2) Be sure the piston ring grooves are free of nicks and burrs.

(3) Measure the ring side clearance with a feeler gauge fitted snugly between the ring land and ring (Fig. 62) (Fig. 63). Rotate the ring in the groove. It must move freely around circumference of the groove.

### GROOVE HEIGHT

**A** 1.530-1.555 mm (0.0602-0.0612 in)

**B** 4.035-4.060 mm (0.1589-0.1598 in)

805dd885

**Fig. 62 Piston Dimensions**

## PISTON RINGS (Continued)

**Fig. 63 Ring Side Clearance Measurement**

1 - FEELER GAUGE

## RING SIDE CLEARANCE CHART

ITEM	SPECIFICATION
Top Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Second Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Oil Control Ring	0.06 - 0.21 mm (0.0024 - 0.0083 in.)

(4) Place ring in the cylinder bore and push down with inverted piston to position near lower end of the ring travel. Measure ring gap with a feeler gauge fitting snugly between ring ends (Fig. 64).

## RING GAP MEASUREMENT CHART

ITEM	SPECIFICATION
Top Compression Ring	0.229 - 0.610 mm (0.0090 - 0.0240 in.)
Second Compression Ring	0.483 - 0.965 mm (0.0190 - 0.080 in.)
Oil Control Ring	0.254 - 1.500 mm (0.010 - 0.060 in.)

805dd892

**Fig. 64 Gap Measurement**

1 - FEELER GAUGE

(5) The oil control rings are symmetrical, and can be installed with either side up. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(6) The two compression rings are different and cannot be interchanged. The top compression ring can be identified by the shiny coating on the outer sealing surface and can be installed with either side up. (Fig. 65).

(7) The second compression ring has a slight chamfer on the bottom of the inside edge and a dot on the top for correct installation (Fig. 66) and (Fig. 67).

(8) Using a ring installer, install the second compression ring with the dot facing up (Fig. 66) (Fig. 68).

(9) Using a ring installer, install the top compression ring (either side up).

## VIBRATION DAMPER

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) and fan shroud.
- (3) Remove the vibration damper retaining bolt and washer.
- (4) Use Vibration Damper Removal Tool 7697 to remove the damper from the crankshaft (Fig. 70).

**Fig. 70 Vibration Damper Removal Tool 7697**

- 1 - VIBRATION DAMPER REMOVAL TOOL  
2 - WRENCH

### INSTALLATION

- (1) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in position, align the keyway on the vibration damper hub with the crankshaft key and tap the damper onto the crankshaft.
- (2) Install the vibration damper retaining bolt and washer.
- (3) Tighten the damper retaining bolt to 108 N·m (80 ft. lbs.) torque.
- (4) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) and fan shroud.
- (5) Connect negative cable to battery.

## STRUCTURAL SUPPORT

### REMOVAL

The engine bending braces are used to add strength to the powertrain and to address some minor NVH concerns.

**NOTE:** Before the engine or the transmission can be removed the engine bending braces must be removed.

- (1) Raise and support vehicle.

**NOTE:** Both left and right side bending braces are removed the sameway. Only the right side is shown.

**NOTE:** The exhaust does not require removal to preform this procedure.

- (2) Remove the exhaust hanger bracket retaining bolt.
- (3) Remove locknut and transmission bending brace bar.
- (4) Remove engine-to-bending brace retaining bolt, bending brace bar and cross bar.

### INSTALLATION

**NOTE:** DO NOT tighten the retaining hardware until all bending braces are in place.

- (1) Position the cross brace into the engine-to-transmission brace, then position the engine-to-transmission brace and install retaining bolt.
- (2) Position the transmission bending brace onto through brace and install new locknut.
- (3) Position exhaust hanger and transmission brace, install retaining bolt (Fig. 72).
- (4) Tighten engine-to-transmission brace retaining bolt (Fig. 71) to 40 N·m (30 ft. lbs.).
- (5) Tighten transmission brace retaining bolts (Fig. 72) to 40 N·m (30 ft. lbs.), then tighten transmission brace retaining lock nuts (Fig. 72) to 108 N·m (80 ft. lbs.).

## LUBRICATION

## DESCRIPTION

A gear-type positive displacement pump is mounted at the underside of the block opposite the No. 4 main bearing.

## OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery which extends the entire length of the block.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals (except number 4 main bearing journal) to the connecting rod journals. Each connecting rod bearing cap has a small squirt hole, oil passes through the squirt hole and is thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. Oil is provided to the camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the number one main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components, then passes down through the push rod guide holes in the cylinder head past the valve tappet area, and returns to the oil pan (Fig. 73).

## LUBRICATION (Continued)

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - ENGINE OIL PRESSURE

(1) Disconnect connector and remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292 or equivalent. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct pressures.

## DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat inspection. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

## Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the CCV valve from the cylinder head cover. Cap or plug the CCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

**CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.**

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.

(5) If the leakage occurs at the rear oil seal area, INSPECTION FOR REAR SEAL AREA LEAKS.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the CCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

## INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.**

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

## OIL

### STANDARD PROCEDURE - ENGINE OIL SERVICE

#### ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist and support vehicle on safety stands.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.

(6) Install drain plug in crankcase.

(7) Replace engine oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type of engine oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level. Refer to CRANKCASE OIL LEVEL INSPECTION.

#### USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine.

#### CRANKCASE OIL LEVEL INSPECTION

**CAUTION:** Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

The engine oil level indicator (Dipstick) is located at the right rear of the 4.0L engine. Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick (Fig. 74).

(1) Position vehicle on level surface.

(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.

(3) Wipe dipstick clean.

(4) Install dipstick and verify it is seated in the tube.

(5) Remove dipstick, with handle held above the tip, take oil level reading (Fig. 74).

(6) Add oil only if level is below the ADD mark on dipstick.

**Fig. 74 Engine Oil Dipstick—4.0L Engine**

- 1 - DIPSTICK
- 2 - ADD
- 3 - SAFE

## OIL FILTER

### REMOVAL

**CAUTION:** Do not use oil filter with metric threads. The proper oil filter has SAE type 3/4 X 16 threads. An oil filter with metric threads can result in oil leaks and engine failure.

All Jeep engines are equipped with a high quality full-flow, throw-away type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss or filter adapter housing.

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) Make sure old gasket comes off with oil filter. With a wiping cloth, clean the gasket sealing surface of oil and grime.

## OIL FILTER (Continued)

## INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 75) hand tighten filter one full turn, do not over tighten.

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

**Fig. 75 Oil Filter Sealing Surface—Typical**

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

## OIL PAN

## DESCRIPTION

The oil pan is made of stamped steel. The oil pan gasket is a one piece steel backbone silicone coated gasket (Fig. 76).

**Fig. 76 Oil Pan**

- 1 - OIL PAN
- 2 - OIL PAN DRAIN PLUG

## REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise the vehicle.

(3) Remove the oil pan drain plug and drain the engine oil.

(4) Disconnect the exhaust pipe at the exhaust manifold.

(5) Disconnect the exhaust hanger at the catalytic converter and lower the pipe.

(6) Remove the starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(7) Remove the engine flywheel and transmission torque converter housing access cover.

(8) If equipped with an oil level sensor, disconnect the sensor.

(9) Position a jack stand directly under the engine vibration damper.

(10) Place a piece of wood (2 x 2) between the jack stand and the engine vibration damper.

(11) Remove the engine mount through bolts.

(12) Using the jack stand, raise the engine until adequate clearance is obtained to remove the oil pan.

(13) Remove transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that are attached to the oil pan studs.

(14) Remove the oil pan bolts and studs. Carefully slide the oil pan and gasket to the rear. If equipped with an oil level sensor, take care not to damage the sensor.

## INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Fabricate 4 alignment dowels from 1 1/2 x 1/4 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 77).

**Fig. 77 Fabrication of Alignment Dowels**

- 1 - 1/4" x 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

(3) Install two dowels in the timing case cover. Install the other two dowels in the cylinder block (Fig. 78).

## OIL PAN (Continued)

J9209-17

**Fig. 78 Position of Dowels in Cylinder Block**

- 1 - DOWEL HOLES
- 2 - CYLINDER BLOCK
- 3 - 5/16" HOLES
- 4 - 5/16" HOLES

(4) Apply Mopar® Silicone Rubber Adhesive Sealant on cylinder block to rear main bearing cap corners and cylinder block to front cover joints (four places) (Fig. 79).

(5) Slide the one-piece gasket over the dowels and onto the block and timing case cover.

(6) Position the oil pan over the dowels and onto the gasket. If equipped with an oil level sensor, take care not to damage the sensor.

(7) Install the 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque. Install the 5/16 inch oil pan bolts (Fig. 80). Tighten these bolts to 15 N·m (132 in. lbs.) torque.

80b897d9

- 1 - SEALER LOCATIONS

80abd2b4

**Fig. 80 Position of 5/16 inch Oil Pan Bolts**

- 1 - OIL PAN
- 2 - OIL PAN DRAIN PLUG

(8) Remove the dowels. Install the remaining 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque.

(9) Lower the engine until it is properly located on the engine mounts.

(10) Install the through bolts and tighten the nuts.

(11) Lower the jack stand and remove the piece of wood.

(12) Install the engine flywheel and transmission torque converter housing access cover.

(13) Install the engine starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(14) Connect the exhaust pipe to the hanger and to the engine exhaust manifold.

(15) Install transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that attach to the oil pan studs.

(16) Install the oil pan drain plug (Fig. 80). Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(17) Lower the vehicle.

(18) Connect negative cable to battery.

(19) Fill the oil pan with engine oil to the specified level.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.**

(20) Start the engine and inspect for leaks.

## ENGINE OIL PRESSURE SENSOR

### DESCRIPTION

The 3-wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

### OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

## OIL PUMP

### REMOVAL

A gear-type oil pump is mounted at the underside of the cylinder block opposite the No.4 main bearing.

- (1) Drain the engine oil.
- (2) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (3) Remove the pump-to-cylinder block attaching bolts. Remove the pump assembly with gasket (Fig. 81).

**CAUTION:** If the oil pump is not to be serviced, DO NOT disturb position of oil inlet tube and strainer assembly in pump body. If the tube is moved within the pump body, a replacement tube and strainer assembly must be installed to assure an airtight seal.

### INSTALLATION

A gear-type oil pump is mounted at the underside of the cylinder block opposite the No.4 main bearing.

J9509-85

**Fig. 81 Oil Pump Assembly**

- 1 - OIL FILTER ADAPTOR
- 2 - BLOCK
- 3 - GASKET
- 4 - OIL INLET TUBE
- 5 - OIL PUMP
- 6 - STRAINER ASSEMBLY
- 7 - ATTACHING BOLTS

(1) Install the oil pump on the cylinder block using a replacement gasket. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(2) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(3) Fill the oil pan with oil to the specified level.

## INTAKE MANIFOLD

### DESCRIPTION

The intake manifold (Fig. 82) is made of cast aluminum and uses eleven bolts to mount to the cylinder head. This mounting style improves sealing and reduces the chance of leaks.

### DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

## INTAKE MANIFOLD (Continued)

80bc4bb8

**Fig. 82 Intake Manifold 4.0L Engine**

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.**

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPM is observed the area of the suspected leak has been found.
- (4) Repair as required.

**REMOVAL**

**NOTE: THE ENGINE INTAKE AND EXHAUST MANIFOLD MUST BE REMOVED AND INSTALLED TOGETHER. THE MANIFOLDS USE A COMMON GASKET AT THE CYLINDER HEAD.**

- (1) Disconnect the battery negative cable.
- (2) Remove air cleaner inlet hose from the resonator assembly.
- (3) Remove the air cleaner assembly.
- (4) Remove the throttle cable, vehicle speed control cable (if equipped) and the transmission line pressure cable (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - REMOVAL).
- (5) Disconnect the following electrical connections and secure their harness out of the way:
  - Throttle Position Sensor
  - Idle Air Control Motor
  - Coolant Temperature Sensor (at thermostat housing)
  - Intake Air Temperature Sensor
  - Oxygen Sensor
  - Crank Position Sensor
  - Six (6) Fuel Injector Connectors
  - Manifold Absolute Pressure (MAP) Sensor.

(6) Disconnect HVAC, and Brake Booster vacuum supply hoses at the intake manifold.

(7) Perform the fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(8) Disconnect and remove the fuel system supply line from the fuel rail assembly.

(9) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Remove the power steering pump from the intake manifold and set aside.

(11) Raise the vehicle.

(12) Disconnect the exhaust pipes from the engine exhaust manifolds.

(13) Lower the vehicle.

(14) Remove the intake manifold and exhaust manifold bolts and manifolds (Fig. 83).

**INSTALLATION**

If the manifold is being replaced, ensure all the fitting, etc. are transferred to the replacement manifold.

(1) Install a new engine exhaust/intake manifold gasket over the alignment dowels on the cylinder head.

(2) Position the engine exhaust manifolds to the cylinder head. Install fastener Number 3 and finger tighten at this time (Fig. 83).

(3) Install intake manifold on the cylinder head dowels.

(4) Install washer and fastener Numbers 1, 2, 4, 5, 8, 9, 10 and 11 (Fig. 83).

(5) Install washer and fastener Numbers 6 and 7 (Fig. 83).

(6) Tighten the fasteners in sequence and to the specified torque (Fig. 83).

• Fastener Numbers 1 through 5—Tighten to 33 N·m (24 ft. lbs.) torque.

• Fastener Numbers 6 and 7—Tighten to 31 N·m (23 ft. lbs.) torque.

• Fastener Numbers 8 through 11—Tighten to 33 N·m (24 ft. lbs.) torque.

(7) Install the power steering pump to the intake manifold.

(8) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install the fuel system supply line to the fuel rail assembly.

(10) Connect all electrical connections on the intake manifold.

(11) Connect the vacuum hoses previously removed.

(12) Install throttle cable, vehicle speed control cable (if equipped).

## INTAKE MANIFOLD (Continued)

**Fig. 83 Intake and Exhaust Manifolds Installation**

(13) Install the transmission line pressure cable (if equipped) (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - INSTALLATION).

(14) Install air cleaner assembly.

(15) Connect air inlet hose to the resonator assembly.

(16) Raise the vehicle.

(17) Connect the exhaust pipes to the engine exhaust manifolds. Tighten the bolts to 31 N·m (23 ft. lbs.)

(18) Lower the vehicle.

(19) Connect the battery negative cable.

(20) Start the engine and check for leaks.

## EXHAUST MANIFOLD

## DESCRIPTION

The two exhaust manifolds (Fig. 84) are log style and are made of high silicon molybdenum cast iron. The exhaust manifolds share a common gasket with the intake manifold. The exhaust manifolds also incorporate ball flange outlets for improved sealing and strain free connections.

## REMOVAL

The intake and engine exhaust manifolds on the 4.0L engine must be removed together. The manifolds use a common gasket at the cylinder head.

(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

## INSTALLATION

(1) The exhaust manifold and the intake manifold must be installed together using a common gasket.

(2) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

## TIMING BELT / CHAIN COVER(S)

## REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Remove the fan, hub assembly and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(4) Remove the accessory drive brackets that are attached to the timing case cover.

(5) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL) (if equipped) and generator bracket assembly from the engine cylinder head and move to one side.

(6) Remove the oil pan-to-timing case cover bolts and timing case cover-to-cylinder block bolts.

(7) Remove the timing case cover and gasket from the engine.

(8) Pry the crankshaft oil seal from the front of the timing case cover (Fig. 85).

## INSTALLATION

Clean the timing case cover, oil pan and cylinder block gasket surfaces.

(1) Install a new crankshaft oil seal in the timing case cover. The open end of the seal should be toward the inside of the cover. Support the cover at the seal area while installing the seal. Force it into position with Seal Installation Tool 6139.

(2) Position the gasket on the cylinder block.

(3) Position the timing case cover on the oil pan gasket and the cylinder block.

(4) Insert Timing Case Cover Alignment and Seal Installation Tool 6139 in the crankshaft opening in the cover (Fig. 86).

(5) Install the timing case cover-to-cylinder block and the oil pan-to-timing case cover bolts.

(6) Tighten the 1/4 inch cover-to-block bolts to 7 N·m (60 in. lbs.) torque. Tighten the 5/16 inch front cover-to-block bolts to 22 N·m (192 in. lbs.) torque. Tighten the oil pan-to-cover 1/4 inch bolts to 9.5 N·m (84 in. lbs.) torque.

(7) Remove the cover alignment tool.

(8) Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(9) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

## TIMING BELT / CHAIN COVER(S) (Continued)

(10) Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION) (if equipped) and generator bracket assembly.

(11) Install the engine fan, hub assembly and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(12) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Connect negative cable to battery.

## TIMING BELT/CHAIN AND SPROCKETS

### REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(3) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Remove the timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Rotate crankshaft until the "0" timing mark is closest to and on the center line with camshaft sprocket timing mark (Fig. 87).

(7) Remove the oil slinger from the crankshaft.

(8) Remove the camshaft sprocket bolt and washer (Fig. 88).

## TIMING BELT/CHAIN AND SPROCKETS (Continued)

80bfe0fa

- 3 - CRANKSHAFT SPROCKET

80bfe167

**Fig. 88 Camshaft Sprocket and Thrust Plate**

- 1 - CAMSHAFT
- 2 - CAMSHAFT SPROCKET W/INTEGRAL KEY
- 3 - BOLT AND WASHER
- 4 - THRUST PLATE

(9) Remove the crankshaft sprocket, camshaft sprocket and timing chain as an assembly.

(10) Installation of the timing chain with the timing marks on the crankshaft and camshaft sprockets properly aligned ensures correct valve timing. A worn or stretched timing chain will adversely affect valve timing. If the timing chain deflects more than 12.7 mm (1/2 inch) replace it.

**INSTALLATION**

Assemble the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned (Fig. 87).

(1) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in the keyway on the crankshaft, install the assembly on the crankshaft and camshaft.

(2) Install the camshaft sprocket bolt and washer (Fig. 88). Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(3) To verify correct installation of the timing chain, rotate the crankshaft 2 revolutions. The camshaft and crankshaft sprocket timing mark should align (Fig. 87).

(4) Install the crankshaft oil slinger.

(5) Replace the oil seal in the timing case cover (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - REMOVAL).

(6) Install the timing case cover and gasket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) With the key installed in the crankshaft keyway, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install the fan, hub assembly and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(10) Connect negative cable to battery.

## ENGINE - 4.7L

### DESCRIPTION—4.7L ENGINE

80b3b148

## ENGINE - 4.7L (Continued)

The 4.7 liter (287 CID) eight-cylinder engine is an 90° single overhead camshaft engine. The cast iron cylinder block is made up of two different components; the first component is the cylinder bore and upper block, the second component is the bedplate that comprises the lower portion of the cylinder block and houses the lower half of the crankshaft main bearings. The cylinders are numbered from front to rear with the left bank being numbered 1,3,5 and 7, and the right bank being numbered 2,4,6 and 8. The firing order is 1-8-4-3-6-5-7-2. The engine serial number is located at the right front side of the engine block (Fig. 1)

**Fig. 1 Engine Identification Location**

## DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE  
DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—PERFORMANCE and (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

## ENGINE - 4.7L (Continued)

## DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	<ol style="list-style-type: none"> <li>1. Weak battery</li> <li>2. Corroded or loose battery connections.</li> <li>3. Faulty starter.</li> <li>4. Replace as necessary.</li> <li>5. Service or replace crankshaft.</li> <li>6. Replace bent connecting rods.</li> </ol>
MAIN BEARING NOISE	<ol style="list-style-type: none"> <li>1. Insufficient oil supply.</li> <li>2. Low oil pressure.</li> <li>3. Thin or diluted oil.</li> <li>4. Excessive bearing clearance.</li> <li>5. Excessive end play.</li> <li>6. Crankshaft journal out-of round.</li> <li>7. Loose flywheel or torque converter.</li> </ol>	<ol style="list-style-type: none"> <li>1. (Refer to LUBRICATION &amp; MAINTENANCE - SPECIFICATIONS)</li> <li>2. Check oil pump, if Ok, check rod and main bearings for excessive wear.</li> <li>3. Change oil and filter.</li> <li>4. Replace as necessary.</li> <li>5. Check thrust washers for wear.</li> <li>6. Service or replace crankshaft.</li> <li>7. Tighten to correct torque</li> </ol>

## ENGINE - 4.7L (Continued)

## DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> <li>1. Gaskets and O-Rings. <ol style="list-style-type: none"> <li>(a) Misaligned or damaged.</li> <li>(b) Loose fasteners, broken or porous metal parts.</li> </ol> </li> <li>2. Crankshaft rear seal</li> <li>3. Crankshaft seal flange. Scratched, nicked or grooved.</li> <li>4. Oil pan flange cracked.</li> <li>5. Timing chain cover seal, damaged or misaligned.</li> <li>6. Scratched or damaged vibration damper hub.</li> </ol>	<ol style="list-style-type: none"> <li>1. <ol style="list-style-type: none"> <li>(a) Replace as necessary.</li> <li>(b) Tighten fasteners, Repair or replace metal parts.</li> </ol> </li> <li>2. Replace as necessary (Refer to 9 - ENGINE/ENGINE BLOCK/ CRANKSHAFT OIL SEAL - REAR - REMOVAL).</li> <li>3. Polish or replace crankshaft.</li> <li>4. Replace oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).</li> <li>5. Replace seal (Refer to 9 - ENGINE/ENGINE BLOCK/ CRANKSHAFT OIL SEAL - FRONT - REMOVAL).</li> <li>6. Polish or replace damper.</li> </ol>
OIL PRESSURE DROP	<ol style="list-style-type: none"> <li>1. Low oil level.</li> <li>2. Faulty oil pressure sending unit.</li> <li>3. Low oil pressure.</li> <li>4. Clogged oil filter.</li> <li>5. Worn oil pump.</li> <li>6. Thin or diluted oil.</li> <li>7. Excessive bearing clearance.</li> <li>8. Oil pump relief valve stuck.</li> <li>9. Oil pick up tube loose, damaged or clogged.</li> </ol>	<ol style="list-style-type: none"> <li>1. Check and correct oil level.</li> <li>2. Replace sending unit (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).</li> <li>3. Check oil pump and bearing clearance.</li> <li>4. Replace oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).</li> <li>5. Replace oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).</li> <li>6. Change oil and filter.</li> <li>7. Replace as necessary.</li> <li>8. Replace oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).</li> <li>9. Replace as necessary.</li> </ol>

## ENGINE - 4.7L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> <li>1. Worn or damaged rings.</li> <li>2. Carbon in oil ring slots.</li> <li>3. Incorrect ring size installed.</li> <li>4. Worn valve guides.</li> <li>5. Leaking valve guide seals.</li> </ol>	<ol style="list-style-type: none"> <li>1. Hone cylinder bores and replace rings.</li> <li>2. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).</li> <li>3. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).</li> <li>4. Ream guides and replace valves (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES &amp; SEATS - STANDARD PROCEDURE).</li> <li>5. Replace valve guide seals.</li> </ol>

## DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs.

(3) Secure the throttle in the wide-open position.

(4) Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).

(5) Remove the ASD relay (Refer to 8 - ELECTRICAL/IGNITION CONTROL/AUTO SHUT DOWN RELAY - REMOVAL).

(6) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(7) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

(8) (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

## DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).

- Leaks between adjacent cylinders or into water jacket.

- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner hose.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

**FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

## ENGINE - 4.7L (Continued)

## CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

## STANDARD PROCEDURE

## STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

**CAUTION:** Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

## STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

**MOPAR® ENGINE RTV GEN II**

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® ATF RTV**

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® GASKET MAKER**

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

## ENGINE - 4.7L (Continued)

**MOPAR® GASKET SEALANT**

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

**FORM-IN-PLACE GASKET AND SEALER APPLICATION**

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

**STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION**

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

**Never** use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 2)

**NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 2)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 2)

**CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.**

**Fig. 2 Proper Tool Usage For Surface Preparation**

- 1 - ABRASIVE PAD  
2 - 3M ROLOC™ BRISTLE DISC  
3 - PLASTIC/WOOD SCRAPER

**STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS**

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 3).

**CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.**

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of

the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

**REMOVAL**

- (1) Disconnect the battery negative cable.
- (2) Remove the front fascia.
- (3) Raise vehicle on hoist.
- (4) Remove exhaust crossover pipe from exhaust manifolds.
- (5) Disconnect two ground straps from the lower left hand side and one ground strap from the lower right hand side of the engine.
- (6) Disconnect crankshaft position sensor. (Fig. 4)
- (7) Remove structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
- (8) Remove starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (9) Remove rubber splash shield.
- (10) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (11) Remove torque converter bolts.
- (12) Remove transmission to engine mounting bolts.
- (13) Disconnect the engine block heater power cable from the block heater.
- (14) Lower vehicle.
- (15) Remove throttle body resonator assembly and inlet hose.
- (16) Disconnect throttle and speed control cables.

**Fig. 4 Crankshaft Position Sensor**

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - CYLINDER HEAD COVER
- 3 - CAMSHAFT POSITION SENSOR
- 4 - RIGHT SIDE CYLINDER BLOCK

(17) Disconnect tube from both the left and right side crankcase breathers, then remove the breathers (Fig. 5).

80b76fa4

**Fig. 5 Crankcase Breather Connection Points**

- 1 - CRANKCASE BREATHERS

(18) Discharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(19) Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) and accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(20) Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

## ENGINE - 4.7L (Continued)

(21) Disconnect transmission oil cooler lines at the radiator.

(22) Disconnect radiator lower hose at the thermostat housing.

(23) Remove A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

(24) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(25) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(26) Disconnect the two heater hoses from the timing chain cover.

(27) Disconnect engine harness at the following points :

- Intake air temperature (IAT) sensor (Fig. 6)
- Fuel Injectors
- Throttle Position (TPS) Switch
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold absolute pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

(28) Release fuel rail pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE) then disconnect the fuel supply quick connect fitting at the fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(29) Remove power steering pump and position out of the way.

(30) Disconnect ground straps from the left side of the engine.

(31) Install Engine Lifting Fixture Special Tool 8347 (Fig. 7) following these steps.

- Holding the lifting fixture at a slight angle, slide the large bore in the front plate over the hex portion of the lifting stud.

- Position the two remaining fixture arms onto the two lifting studs in the cylinder heads.

- Pull forward and upward on the lifting fixture so that the lifting stud rest in the slotted area below the large bore.

- Secure the lifting fixture to the three studs using three 7/16 - 14 N/C locknuts.

- Make sure the lifting loop in the lifting fixture is in the last hole (closest to the throttle body) to minimize the angle of engine during removal.

(32) Disconnect body ground strap at the right side cowl.

**NOTE:** It will be necessary to support the transmission in order to remove the engine.

(33) Position a suitable jack under the transmission.

**Fig. 6 Throttle Body Connection Points**

- 1 - THROTTLE BODY
- 2 - TPS
- 3 - IAC MOTOR
- 4 - IAT SENSOR (THREADED TYPE)
- 5 - MOUNTING SCREWS

(34) Remove the engine mount through bolts.

(35) Raise engine slightly, then remove both left and right side engine mounts from engine. (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - REMOVAL).

(36) Remove engine from the vehicle.

## INSTALLATION

(1) Position engine in the vehicle.

(2) Install both left and right side engine mounts onto engine (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - INSTALLATION).

(3) Install transmission to engine mounting bolts. Tighten the bolts to 41 N·m (30 ft. lbs.).

(4) Remove jack from under the transmission.

(5) Remove engine lifting fixture special tool 8347 (Fig. 7).

(6) Connect ground straps on the left side of the engine.

(7) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(8) Connect fuel supply line quick connect fitting (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/

## ENGINE - 4.7L (Continued)

**Fig. 7 Engine Lifting Fixture Attachment Locations**

- 1 - ATTACHING LOCATION  
 2 - ADJUSTABLE HOOK  
 3 - SPECIAL TOOL 8347 ENGINE LIFT FIXTURE  
 4 - ATTACHING LOCATIONS

**QUICK CONNECT FITTING - STANDARD PROCEDURE).**

(9) Connect engine harness at the following points (Fig. 6):

- Intake Air Temperature (IAT) Sensor
- Idle Air Control (IAC) Motor
- Fuel Injectors
- Throttle Position (TPS) Switch
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

(10) Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(11) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(12) Install A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(13) Connect radiator lower hose at the thermostat housing.

(14) Connect the transmission oil cooler lines to the radiator.

(15) Install A/C compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(16) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) and radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(17) Install breathers, then connect tube to both crankcase breathers (Fig. 5).

(18) Connect throttle and speed control cables.

(19) Install throttle body resonator assembly and inlet hose.

(20) Raise vehicle.

(21) Connect two ground straps on the lower left hand side of the engine and one ground strap on the lower right side.

(22) Install torque converter bolts.

(23) Connect crankshaft position sensor (Fig. 4).

(24) Install starter.

(25) Install rubber splash shield.

**CAUTION:** The structural cover requires a specific torque sequence. Failure to follow this sequence may cause severe damage to the cover.

(26) Install structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(27) Install exhaust crossover pipe.

(28) Install engine block heater power cable, If equipped.

(29) Lower vehicle.

(30) Check and fill engine oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(31) Recharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(32) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(33) Connect the battery negative cable.

(34) Start engine and check for leaks.

ENGINE - 4.7L (Continued)

## SPECIFICATIONS

## 4.7L ENGINE

DESCRIPTION	SPECIFICATION
<b>GENERAL SPECIFICATIONS</b>	
Engine Type	90° SOHC V-8 16-Valve
Displacement	4.7 Liters / 4701cc (287 Cubic Inches)
Bore	93.0 mm (3.66 in.)
Stroke	86.5 mm (3.40 in.)
Compression Ratio	9.0:1
Horsepower	235 BHP @ 4800 RPM
Torque	295 LB-FT @ 3200 RPM
Lead Cylinder	#1 Left Bank
Firing Order	1-8-4-3-6-5-7-2
<b>CYLINDER BLOCK</b>	
Cylinder Block	Cast Iron
Bore Diameter	93.010 ± .0075 mm (3.6619 ± 0.0003 in.)

## AIR CLEANER ELEMENT

## REMOVAL - 4.7L

- (1) Unlatch four clips retaining air cleaner cover to air cleaner housing (Fig. 8).
- (2) Lift cover up and position to the side.
- (3) Remove air cleaner element.

## INSTALLATION - 4.7L

- (1) Clean inside of air cleaner housing before installing new element.
- (2) Install air cleaner element into housing.
- (3) Latch clips and clamp cover down to secure. Be sure air cleaner cover is properly seated to air cleaner housing.

80b89902

*Fig. 8 Air Cleaner Assembly - 4.7L*

- 1 - AIR DUCT
- 2 - CLAMPS
- 3 - AIR CLEANER COVER
- 4 - CLIPS
- 5 - HOUSING
- 6 - HOUSING BOLTS (3)
- 7 - LOWER HOUSING NUTS (3)
- 8 - RESONATOR BOLTS
- 9 - RESONATOR

## AIR CLEANER HOUSING

## REMOVAL - 4.7L

- (1) Disconnect air cleaner cover-to-air duct clamp (Fig. 8).
- (2) Disconnect air duct at housing.
- (3) **Each of the 3 air cleaner housing mounting bolts is attached with 2 nuts (an upper nut and lower nut). DO NOT REMOVE BOLTS. To prevent stripping bolts, only remove lower nuts. The lower housing nuts are located under left front inner fender (Fig. 8).**
  - (a) To gain access to lower nuts, raise vehicle.
  - (b) Remove clips retaining rubber inner fender shield.
  - (c) Pry back shield enough to gain access to lower nuts.
  - (d) Remove 3 nuts.
  - (e) Remove air cleaner assembly from vehicle.

## AIR CLEANER HOUSING (Continued)

(4) If resonator is to be removed, disconnect breather tube at resonator, disconnect air duct clamp at resonator (Fig. 8) and remove 2 resonator mounting bolts (at sides of resonator). Remove resonator from throttle body by loosening clamp at throttle body.

## INSTALLATION - 4.7L

(1) Position air cleaner assembly to body and install 3 nuts. Tighten nuts to 10 N·m (93 in. lbs.) torque. **To prevent excessive vibration transmitted through housing, the nuts must be properly torqued. Do not overtighten nuts.**

(2) If resonator was removed: Install resonator and bolts. Tighten bolts to 4 N·m (35 in. lbs.) torque. Tighten clamp at throttle body to 4 N·m (35 in. lbs.) torque.

(3) Position fender liner and install clips.

(4) Connect air duct at housing (Fig. 8).

(5) Tighten air duct clamp.

(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Oil leak or excessive cam bore wear in cylinder head.

(11) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace.

c. Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

## CYLINDER HEAD - LEFT

## DESCRIPTION

## DESCRIPTION - CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

## DESCRIPTION - VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

## DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

## CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

## CYLINDER HEAD - LEFT (Continued)

## CYLINDER-TO-WATER JACKET LEAKAGE TEST

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.**

## VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

## COOLING SYSTEM TESTER METHOD

**WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).**

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

## CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

## REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise the vehicle on a hoist.
- (3) Disconnect the exhaust pipe at the left side exhaust manifold.
- (4) Drain the engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Lower the vehicle.
- (6) Remove the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (7) Remove the cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (8) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (9) Remove the power steering pump and set aside.
- (10) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 9).

**Fig. 9 Engine Top Dead Center**

- 1 - TIMING CHAIN COVER  
2 - CRANKSHAFT TIMING MARKS

(11) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 11). Rotate the crankshaft one turn if necessary.

(12) Remove the crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(14) Lock the secondary timing chains to the idler sprocket using Special Tool 8515 (Fig. 10).

**NOTE: Mark the secondary timing chain prior to removal to aid in installation.**

(15) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 11).

(16) Remove the left side secondary chain tensioner. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove the cylinder head access plug (Fig. 12).

(18) Remove the left side secondary chain guide. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(19) Remove the retaining bolt and the camshaft drive gear.

**CAUTION: Do not allow the engine to rotate. Severe damage to the valve train can occur.**

## CYLINDER HEAD - LEFT (Continued)

**CAUTION:** Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

80b897e2

**Fig. 12 Cylinder Head Access Plugs**

- 1 - RIGHT CYLINDER HEAD ACCESS PLUG
- 2 - LEFT CYLINDER HEAD ACCESS PLUG

**NOTE:** The cylinder head is attached to the cylinder block with fourteen bolts.

- (20) Remove the cylinder head retaining bolts.
- (21) Remove the cylinder head and gasket. Discard the gasket.

**CAUTION:** Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

80b3c642

**Fig. 11 Camshaft Sprocket V8 Marks**

- 1 - LEFT CYLINDER HEAD

- 2 - RIGHT CYLINDER HEAD

## CYLINDER HEAD - LEFT (Continued)

## CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## INSPECTION

(1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.

(2) Inspect the valve seats for damage. Service the valve seats as necessary.

(3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

## INSTALLATION

**NOTE:** The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 13).

**Fig. 13 Checking Cylinder Head Bolts for Stretching (Necking)**

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

**CAUTION:** When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Refer to 9 - ENGINE - STANDARD PROCEDURE).

(2) Position the new cylinder head gasket on the locating dowels.

**CAUTION:** When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

**NOTE:** The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M11 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

**NOTE:** The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence (Fig. 14) using the following steps and torque values:

- Step 1: Tighten bolts 1-10, 27 N·m (20 ft. lbs.).
- Step 2: Verify that bolts 1-10, all reached 27 N·m (20 ft. lbs.), by repeating step-1 without loosening the bolts. Tighten bolts 11 thru 14 to 14 N·m (10 ft. lbs.).
- Step 3: Tighten bolts 1-10, 90 degrees.
- Step 4: Tighten bolts 1-10, 90 degrees, again. Tighten bolts 11-14, 26 N·m (19 ft. lbs.).

◆ INDICATES SEALER APPLIED TO THREADS

**Fig. 14 Cylinder Head Tightening Sequence**

(7) Install the secondary chain and secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(8) Install the cylinder head access plug.

(9) Re-set and Install the left side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Remove Special Tool 8515.

## CYLINDER HEAD - LEFT (Continued)

(11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(13) Install the power steering pump.

(14) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(16) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(17) Raise the vehicle.

(18) Install the exhaust pipe onto the left exhaust manifold.

(19) Lower the vehicle.

(20) Connect the negative cable to the battery.

(21) Start the engine and check for leaks.

**CAUTION:** When removing the cam sprocket, timing chains or camshaft, Failure to use Special Tool 8350 will result in hydraulic tensioner ratchet over extension, requiring timing chain cover removal to reset the tensioner ratchet.

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

**CAUTION:** Do not hold or pry on the camshaft target wheel (Located on the right side camshaft sprocket) for any reason, Severe damage will occur to the target wheel resulting in a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave the bolt snug against the sprocket.

## CAMSHAFT(S) - LEFT

## DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

## REMOVAL

**CAUTION:** When the timing chain is removed and the cylinder heads are still installed, **DO NOT** forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

**NOTE:** The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

**CAUTION:** Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands, tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 15).

**NOTE:** When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(6) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 16).

## CAMSHAFT(S) - LEFT (Continued)

**Fig. 16 Camshaft Sprocket and Chain**

- 1 - CAMSHAFT SPROCKET AND CHAIN  
2 - ADJUSTABLE PLIERS  
3 - CAMSHAFT

(7) Using the pliers, gently allow the camshaft to rotate 15° clockwise until the camshaft is in the neutral position (no valve load).

(8) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

**CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**

**NOTE:** When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(9) Remove the camshaft bearing caps and the camshaft.

## CAMSHAFT(S) - LEFT (Continued)

## INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

**NOTE:** Position the left side camshaft so that the camshaft sprocket dowel is near the 1 o'clock position. This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

(4) Working in  $\frac{1}{2}$  turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 17).

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 18).

**NOTE:** When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

80b6b398

**Fig. 17 Camshaft Bearing Caps Tightening Sequence**

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 19).

4 - SPECIAL TOOL 8350 WEDGE

**Fig. 19 Camshaft Sprocket Installation**

- 1 - ADJUSTABLE PLIERS  
2 - CAMSHAFT DOWEL

**CAUTION:** Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

(8) Remove excess oil from bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove Special Tool 8350 timing chain wedge (Fig. 20).

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346 (Fig. 21), torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

(11) Install the cylinder head cover.

## CAMSHAFT(S) - LEFT (Continued)

**Fig. 21 Tightening Left Side Cam Sprocket Retaining Bolt**

- 1 - TORQUE WRENCH
- 2 - CAMSHAFT SPROCKET
- 3 - LEFT CYLINDER HEAD

## CYLINDER HEAD COVER(S) - LEFT

## DESCRIPTION

The cylinder head covers are made of injection molded thermo-set plastic, and are not interchangeable from side-to-side. It is imperative that nothing rest on the cylinder head covers. Prolonged contact with other items may wear a hole in the cylinder head cover.

## REMOVAL - LEFT SIDE

- (1) Disconnect negative cable from battery.
- (2) Remove the resonator assemble and air inlet hose.
- (3) Disconnect injector connectors and un-clip the injector harness.

(4) Route injector harness in front of cylinder head cover.

(5) Disconnect the left side breather tube and remove the breather tube.

(6) Remove the cylinder head cover mounting bolts.

(7) Remove cylinder head cover and gasket.

**NOTE:** The gasket may be used again, provided no cuts, tears, or deformation has occurred.

## CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

## INSTALLATION—LEFT SIDE

**CAUTION:** Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.

(2) Install cylinder head cover and hand start all fasteners. Verify that all studs are in the correct location shown in (Fig. 22).

**Fig. 22 Cylinder Head Cover-Left**

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

(3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs.).

(4) Install left side breather and connect breather tube.

(5) Connect injector electrical connectors and injector harness retaining clips.

(6) Install the resonator and air inlet hose.

(7) Connect negative cable to battery.

## INTAKE/EXHAUST VALVES & SEATS

### DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

### STANDARD PROCEDURE - REFACING

**NOTE:** Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

**NOTE:** When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in.).

(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

(3) When the seat is properly positioned the width of the intake seat must be 1.75 – 2.36 mm (0.0689 – 0.0928 in.) and the exhaust seat must be 1.71 – 2.32 mm (0.0673 – 0.0911 in.).

(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.).

(5) The valve seat and valve face must maintain a face angle of 44.5 – 45 degrees angle (Fig. 23).

### REMOVAL

**NOTE:** The cylinder heads must be removed in order to preform this procedure.

(1) Remove rocker arms and lash adjusters. Refer to procedures in this section (Fig. 24).

(2) Remove the camshaft bearing caps and the camshaft.

80b8983f

**Fig. 24 Rocker Arm Removal**

- 1 - CAMSHAFT
- 2 - SPECIAL TOOL 8516

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

**NOTE:** All eight valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422-B or C-3422-C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

**NOTE:** It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(4) Remove the two spring retainer lock halves.

**NOTE:** the valve spring is under tension use care when releasing the valve spring compressor.

(5) Remove the valve spring compressor.

(6) Remove the spring retainer, and the spring.

**NOTE:** Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

(7) Remove the valve from the cylinder head.

**NOTE:** The valve stem seals are common between intake and exhaust.

(8) Remove the valve stem seal. Mark the valve for proper installation.

## TESTING VALVE SPRINGS

**NOTE:** Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications. (Fig. 25)

## INSTALLATION

(1) coat the valve stem with clean engine oil and insert it into the cylinder head.

(2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

9209-37

Fig. 25 Testing Valve Springs

1 - SPECIAL TOOL C-647

(3) Install the spring and the spring retainer (Fig. 26).

(4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

(5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

80b8983f

Fig. 26 Valve Assembly Configuration

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

## INTAKE/EXHAUST VALVES & SEATS (Continued)

(6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

(7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9–13 N·m (100 in. lbs.) in ½ turn increments in the sequence shown (Fig. 27).

80b6b398

**Fig. 27 Camshaft Bearing Caps Tightening Sequence**

(8) Position the hydraulic lash adjusters and rocker arms (Fig. 24).

## ROCKER ARM / ADJUSTER ASSEMBLY

### DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

### REMOVAL

**NOTE:** Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) For rocker arm removal on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(3) For rocker arm removal on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(4) For rocker arm removal on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(5) For rocker arm removal on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(6) Using special tool 8516 Rocker Arm Remover, press downward on the valve spring, remove rocker arm (Fig. 28).

80b76fa5

**Fig. 28 Rocker Arm—Removal**

- 1 - CAMSHAFT
- 2 - SPECIAL TOOL 8516

### INSTALLATION

**CAUTION:** Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

**NOTE:** Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

## ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

(2) For rocker arm installation on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(3) For rocker arm installation on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(4) For rocker arm installation on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 28).

(6) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## VALVE SPRINGS

## DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are common for intake and exhaust applications, **except for the 4.7L H.O. which has unique intake and exhaust springs**. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

## VALVE STEM SEALS

## DESCRIPTION

The valve stem seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

## CYLINDER HEAD - RIGHT

## DESCRIPTION

## DESCRIPTION - CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

## DESCRIPTION - VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

## CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

## CYLINDER-TO-WATER JACKET LEAKAGE TEST

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.**

## VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

## COOLING SYSTEM TESTER METHOD

**WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).**

## CYLINDER HEAD - RIGHT (Continued)

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

## CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

## DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Oil leak or excessive cam bore wear in cylinder head.

(11) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace.

c. Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

## REMOVAL

(1) Disconnect battery negative cable.

(2) Raise the vehicle on a hoist.

(3) Disconnect the exhaust pipe at the right side exhaust manifold.

(4) Drain the engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower the vehicle.

(6) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(7) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(8) Remove oil fill housing from cylinder head.

(9) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 9).

(11) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 11). Rotate the crankshaft one turn if necessary.

(12) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(14) Lock the secondary timing chains to the idler sprocket using Special Tool 8515 (Fig. 10).

**NOTE:** Mark the secondary timing chain prior to removal to aid in installation.

(15) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 11).

(16) Remove the right side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove the cylinder head access plug (Fig. 29).

**Fig. 29 Cylinder Head Access Plugs**

1 - RIGHT CYLINDER HEAD ACCESS PLUG

2 - LEFT CYLINDER HEAD ACCESS PLUG

## CYLINDER HEAD - RIGHT (Continued)

(18) Remove the right side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(19) Remove the retaining bolt and the camshaft drive gear.

**CAUTION:** Do not allow the engine to rotate. severe damage to the valve train can occur.

**CAUTION:** Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

**CAUTION:** Do not hold or pry on the camshaft target wheel for any reason. A damaged target wheel can result in a vehicle no start condition.

**NOTE:** The cylinder head is attached to the cylinder block with fourteen bolts.

(20) Remove the cylinder head retaining bolts.

(21) Remove the cylinder head and gasket. Discard the gasket.

**CAUTION:** Do not lay the cylinder head on its gasket sealing surface, do to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

## CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## INSPECTION

(1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.

(2) Inspect the valve seats for damage. Service the valve seats as necessary.

(3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

## INSTALLATION

**NOTE:** The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 13).

**CAUTION:** When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Refer to 9 - ENGINE - STANDARD PROCEDURE).

(2) Position the new cylinder head gasket on the locating dowels.

**CAUTION:** When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

**NOTE:** The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M10 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar Lock and Seal Adhesive** then install the bolts.

**NOTE:** The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence (Fig. 30) using the following steps and torque values:

- Step 1: Tighten bolts 1-10, 27 N·m (20 ft. lbs.).
- Step 2: Verify that bolts 1-10, all reached 27 N·m (20 ft. lbs.), by repeating step-1 without loosening the bolts. Tighten bolts 11 thru 14 to 14 N·m (10 ft. lbs.).

- Step 3: Tighten bolts 1-10, 90 degrees.

- Step 4: Tighten bolts 1-10, 90 degrees, again. Tighten bolts 11-14, 26 N·m (19 ft. lbs.)

(7) Install the secondary chain and secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(8) Install the cylinder head access plug.

(9) Re-set and install the right side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Remove Special Tool 8515.

## CYLINDER HEAD - RIGHT (Continued)

**Fig. 30 Cylinder Head Tightening Sequence**

(11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(13) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(14) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(16) Install oil fill housing onto cylinder head.

(17) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(18) Raise the vehicle.

(19) Install the exhaust pipe onto the right exhaust manifold.

(20) Lower the vehicle.

(21) Reconnect battery negative cable.

(22) Start the engine and check for leaks.

## CAMSHAFT(S) - RIGHT

## DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

## REMOVAL

**CAUTION:** When the timing chain is removed and the cylinder heads are still installed, **DO NOT** forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

**CAUTION:** When removing the cam sprocket, timing chains or camshaft, Failure to use special tool 8350 will result in hydraulic tensioner ratchet over extension, Requiring timing chain cover removal to re-set the tensioner ratchet.

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

**CAUTION:** Do not hold or pry on the camshaft target wheel for any reason, Severe damage will occur to the target wheel. A damaged target wheel could cause a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave bolt snug against sprocket.

**NOTE:** The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

**CAUTION:** Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands. Tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 31).

(6) Remove the camshaft position sensor (Fig. 32).

**NOTE:** When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(7) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 33).

## CAMSHAFT(S) - RIGHT (Continued)

2 - SPROCKET BOLT  
3 - CAMSHAFT SPROCKET AND CHAIN  
4 - CAMSHAFT

## CAMSHAFT(S) - RIGHT (Continued)

(8) Using the pliers, gently allow the camshaft to rotate 45° counter-clockwise until the camshaft is in the neutral position (no valve load).

(9) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

**CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**

**NOTE:** When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(10) Remove the camshaft bearing caps and the camshaft.

## INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

**NOTE:** Position the right side camshaft so that the camshaft sprocket dowel is near the 10 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 34).

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 35).

**NOTE:** When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 36).

80b6b398

**Fig. 34 Camshaft Bearing Caps Tightening Sequence**

**CAUTION:** Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

(8) Remove excess oil from camshaft sprocket bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove timing chain wedge special tool 8350 (Fig. 31).

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346 (Fig. 37), torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

(11) Install the camshaft position sensor (Fig. 32).

(12) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## CYLINDER HEAD COVER(S) - RIGHT

### DESCRIPTION

The cylinder head covers are made of injection molded thermo-set plastic, and are not interchangeable from side-to-side. It is imperative that nothing rest on the cylinder head covers. Prolonged contact with other items may wear a hole in the cylinder head cover.

### REMOVAL - RIGHT SIDE

- (1) Disconnect battery negative cable.
- (2) Disconnect battery positive cable.
- (3) Remove the battery tray.
- (4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (6) Remove air conditioning compressor retaining bolts and move compressor to the left.
- (7) Remove heater hoses.
- (8) Disconnect injector and ignition coil connectors.
- (9) Disconnect and remove positive crankcase ventilation (PCV) hose.
- (10) Remove oil fill tube.
- (11) Un-clip injector and ignition coil harness and move away from cylinder head cover.
- (12) Remove right rear breather tube and filter assembly.
- (13) Remove cylinder head cover retaining bolts.
- (14) Remove cylinder head cover.

**NOTE:** The gasket may be used again, provided no cuts, tears, or deformation has occurred.

### CLEANING

- Clean cylinder head cover gasket surface.
- Clean head rail, if necessary.

### INSTALLATION - RIGHT SIDE

**CAUTION:** Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

- (1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
- (2) Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location shown in (Fig. 38).
- (3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs).

**Fig. 38 Cylinder Head Cover—Right**

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

- (4) Install right rear breather tube and filter assembly.
- (5) Connect injector, ignition coil electrical connectors and harness retaining clips.
- (6) Install the oil fill tube.
- (7) Install PCV hose.
- (8) Install heater hoses.
- (9) Install air conditioning compressor retaining bolts.
- (10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (11) Fill Cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (12) Install air cleaner assembly, resonator assembly and air inlet hose.
- (13) Connect battery negative cable.

## INTAKE/EXHAUST VALVES & SEATS

### DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

### STANDARD PROCEDURE - REFACING

**NOTE:** Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

**NOTE:** When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in.).

(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

(3) When the seat is properly positioned the width of the intake seat must be 1.75 – 2.36 mm (0.0689 – 0.0928 in.) and the exhaust seat must be 1.71 – 2.32 mm (0.0673 – 0.0911 in.).

(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.).

(5) The valve seat and valve face must maintain a face angle of 44.5 – 45 degrees angle (Fig. 39).

80b8983f

**Fig. 39 Valve Assembly Configuration**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

## REMOVAL

**NOTE:** The cylinder heads must be removed in order to preform this procedure.

(1) Remove rocker arms and lash adjusters. Refer to procedures in this section (Fig. 40).

80b76fa5

**Fig. 40 Rocker Arm Removal**

- 1 - CAMSHAFT
- 2 - SPECIAL TOOL 8516

(2) Remove the camshaft bearing caps and the camshaft.

**NOTE:** All eight valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422-B or C-3422-C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

**NOTE:** It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(4) Remove the two spring retainer lock halves.

**NOTE:** the valve spring is under tension use care when releasing the valve spring compressor.

(5) Remove the valve spring compressor.

(6) Remove the spring retainer, and the spring.

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

**NOTE:** Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

(7) Remove the valve from the cylinder head.

**NOTE:** The valve stem seals are common between intake and exhaust.

(8) Remove the valve stem seal. Mark the valve for proper installation.

## TESTING VALVE SPRINGS

**NOTE:** Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications. (Fig. 41)

**Fig. 41 Testing Valve Springs**

1 - SPECIAL TOOL C-647

## INSTALLATION

(1) coat the valve stem with clean engine oil and insert it into the cylinder head.

(2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

(3) Install the spring and the spring retainer (Fig. 42).

(4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

(5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

80b8983f

**Fig. 42 Valve Assembly Configuration**

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

(6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

(7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N·m (100 in. lbs.) in ½ turn increments in the sequence shown (Fig. 43).

(8) Position the hydraulic lash adjusters and rocker arms (Fig. 40).

## INTAKE/EXHAUST VALVES &amp; SEATS (Continued)

80b6b398

**Fig. 43 Camshaft Bearing Caps Tightening Sequence**

## ROCKER ARM / ADJUSTER ASSEMBLY

### DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

### REMOVAL

**NOTE:** Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) For rocker arm removal on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(3) For rocker arm removal on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(4) For rocker arm removal on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(5) For rocker arm removal on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(6) Using special tool 8516 Rocker Arm Remover, press downward on the valve spring, remove rocker arm (Fig. 44).

80b76fa5

**Fig. 44 Rocker Arm—Removal**

- 1 - CAMSHAFT
- 2 - SPECIAL TOOL 8516

### INSTALLATION

**CAUTION:** Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

**NOTE:** Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(2) For rocker arm installation on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(3) For rocker arm installation on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(4) For rocker arm installation on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 44).

(6) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## VALVE SPRINGS

### DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are common for intake and exhaust applications, **except for the 4.7L H.O. which has unique intake and exhaust springs**. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

## VALVE STEM SEALS

### DESCRIPTION

The valve stem seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

## ENGINE BLOCK

### DESCRIPTION

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

### STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

**CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.**

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing

oil C-3501-3880, or a light honing oil, available from major oil distributors.

**CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.**

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should **INTERSECT** at 50° to 60° for proper seating of rings (Fig. 45).

80861d41

**Fig. 45 CYLINDER BORE CROSSHATCH PATTERN**

1 - CROSSHATCH PATTERN  
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

### CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

## ENGINE BLOCK (Continued)

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

## INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer (Fig. 46).

**Fig. 46 BORE GAUGE-TYPICAL**

805dd884

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 38 MM (1.5 in)

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional readings.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can

be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

## CONNECTING ROD BEARINGS

## STANDARD PROCEDURE - CONNECTING ROD BEARING FITTING

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 47). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 48). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

J8909-128

**Fig. 47 Locking Tab Inspection**

1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

J8909-129

**Fig. 48 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal**

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

## CONNECTING ROD BEARINGS (Continued)

- (1) Wipe the oil from the connecting rod journal.
- (2) Lubricate the upper bearing insert and install in connecting rod.
- (3) Use piston ring compressor and Guide Pins Special Tool 8507 (Fig. 49) to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The "F"'s near the piston wrist pin bore should point to the front of the engine.

**Fig. 49 Piston and Connecting Rod - Installation**

- 1 - "F" TOWARD FRONT OF ENGINE
- 2 - OIL SLINGER SLOT
- 3 - RING COMPRESSOR
- 4 - SPECIAL TOOL 8507

(4) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

(5) Install bearing cap and connecting rod on the journal and tighten bolts to 27 N·m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

(6) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 50). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the**

**clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

**Fig. 50 Measuring Bearing Clearance with Plastigage**

- 1 - PLASTIGAGE SCALE
- 2 - COMPRESSED PLASTIGAGE

(7) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(8) If bearing-to-journal clearance exceeds the specification, determine which services bearing set to use the bearing sizes are as follows:

Bearing Mark	SIZE	USED WITH JOURNAL SIZE
<b>.025 US</b>	.025 mm (.001 in.)	50.983-50.967 mm (2.0073-2.0066 in.)
<b>Std.</b>	STANDARD	50.992-51.008 mm (2.0076-2.0082 in.)
<b>.250 US</b>	.250 mm (.010 in.)	50.758-50.742 mm (1.9984-1.9978 in.)

(9) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

**CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.**

## CONNECTING ROD BEARINGS (Continued)

(10) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N·m (20 ft. lbs.) plus a 90° turn.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 51). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

**Fig. 51 Checking Connecting Rod Side Clearance - Typical**

## CRANKSHAFT

## DESCRIPTION

The 4.7L crankshaft is constructed of nodular cast iron. The crankshaft for the 4.7L H.O. is constructed of **forged steel**. The crankshaft is a cross shaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by five select fit main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The number eight counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel. The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly.

## STANDARD PROCEDURE - MEASURING CRANKSHAFT END PLAY

- (1) Mount a dial indicator to front of engine with the locating probe on nose of crankshaft (Fig. 52).
- (2) Move crankshaft all the way to the rear of its travel.
- (3) Zero the dial indicator.

- (4) Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

**Fig. 52 Checking Crankshaft End Play—Typical**

**NOTE:** To remove the crankshaft from the engine, the engine must be removed from the vehicle.

- (1) Remove the engine. (Refer to 9 - ENGINE - REMOVAL).
- (2) Remove the engine oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

**CAUTION:** DO NOT pry on the oil pan gasket when removing the oil pan. The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.

- (3) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (4) Remove the oil pump pickup tube and oil pan gasket /windage tray.
- (5) Remove the bedplate mounting bolts. Note the location of the three stud bolts for installation.
- (6) Remove the connecting rods from the crankshaft.

**CAUTION:** The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.

**NOTE:** The bedplate contains the lower main bearing halves. Use care when handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause sever damage to the crankshaft.

## CRANKSHAFT (Continued)

**NOTE:** The bedplate has pry points cast into it. Use these points only. The pry points are on both the left and right sides, only the left side is shown.

(7) Carefully pry on the pry points (Fig. 53) to loosen the bedplate then remove the bedplate.

80c07275

**Fig. 53 Bedplate Pry Point Location**

- 1 - CYLINDER BLOCK
- 2 - BEDPLATE
- 3 - PRY POINT

**CAUTION:** When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

- (8) Remove the crankshaft.
- (9) Remove the crankshaft target wheel.

## INSPECTION

**NOTE:** Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

(1) If required, remove the main bearing halves from the cylinder block and bedplate.

(2) Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.

(3) Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.

(4) Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing. If either condition exist replace the thrust washer.

(5) Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

## INSTALLATION

**CAUTION:** Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) for proper bearing selections.

(1) Lubricate upper main bearing halves with clean engine oil.

**CAUTION:** When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

**NOTE:** Apply sealant to the target wheel retaining screws prior to installation.

(2) Install the crankshaft target wheel. Torque the mounting screws to 15 N·m (12 ft. lbs.).

(3) Position crankshaft in cylinder block.

(4) Install the thrust washers (Fig. 54).

80b77054

**Fig. 54 Crankshaft Thrust Washer Installation**

- 1 - CRANKSHAFT THRUST WASHER

## CRANKSHAFT (Continued)

**CAUTION:** The bedplate to cylinder block mating surface must be coated with sealant prior to installation. Failure to do so will cause severe oil leaks.

**NOTE:** The installation time to install the bedplate after the sealant has been applied is critical.

**NOTE:** Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.

(5) Apply a 2.5mm (0.100 inch) (Fig. 55) bead of Mopar® Gen II Silicone Rubber Adhesive sealant to the cylinder block-to-bedplate mating surface as shown (Fig. 56).

80b897e0

**Fig. 55 Cutting Applicator to Achieve 2.5mm (0.100 in.) Bead**

1 - CUT HERE

(6) Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

80ba77f6

**Fig. 56 Cylinder Block-to-Bedplate Sealant Bead Location**

1 - CYLINDER BLOCK  
2 - SEALANT BEAD LOCATION

**NOTE:** Lubricate the bedplate retaining bolts with clean engine oil prior to installation.

(7) Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location. Torque the bolts in the sequence shown (Fig. 57).

- Tighten bolts **A - L** to 54 N·m (40 ft. lbs.)
- Tighten bolts **1-10** to 2.8 N·m (25 in. lbs.)
- Turn bolts **1-10** an additional 90°.
- Tighten bolts **A1- A6** to 27 N·m (20 ft. lbs.)

(8) Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(9) Install the connecting rods and measure side clearance. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

(10) Position the oil pan gasket/windage tray, using a new o-ring, install the oil pickup tube. Torque the bolt to 28N·m (20 ft. lbs.) torque the nuts to 28N·m (20 ft. lbs.).

(11) Install the oil pan. Torque the retaining bolts to 15 N·m (11 ft. lbs.) in the sequence shown (Fig. 58).

(12) Install the engine (Refer to 9 - ENGINE - INSTALLATION).

## CRANKSHAFT (Continued)

**Fig. 57 Bedplate Tightening Sequence**

1 - BEDPLATE

2 - CYLINDER BLOCK

**Fig. 58 Oil Pan Tightening Sequence****CRANKSHAFT MAIN BEARINGS****STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING - FITTING****MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)**

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

## CRANKSHAFT MAIN BEARINGS (Continued)

## CRANKSHAFT MAIN BEARING SELECTION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel has grade identification marks stamped into it (Fig. 59). These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5. The crankshaft position sensor target wheel is mounted to the number 8 counter weight on the crankshaft.

**Fig. 59 Main Bearing Markings on Target Wheel**

- 1 - REARMOST CRANKSHAFT COUNTER WEIGHT
- 2 - TARGET WHEEL
- 3 - MAIN BEARING SELECT FIT MARKINGS

**NOTE:** Service main bearings are coded. These codes identify what size (grade) the bearing is.

## MAIN BEARING SELECTION CHART—4.7L

GRADE MARKING	SIZE mm (in.)	FOR USE WITH JOURNAL SIZE
<b>A</b>	0.008 mm U/S (0.0004 in.) U/S	63.488–63.496 mm (2.4996–2.4999 in.)
<b>B</b>	NOMINAL	63.496–63.504 mm (2.4999–2.5002 in.)
<b>C</b>	0.008 mm O/S (0.0004 in.) O/S	63.504–63.512 mm (2.5002–2.5005 in.)

## INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 60).

**Fig. 60 Main Bearing Wear Patterns**

- 1 - UPPER INSERT
- 2 - NO WEAR IN THIS AREA
- 3 - LOW AREA IN BEARING LINING
- 4 - LOWER INSERT

**NOTE:** If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.  
Replace all damaged or worn bearing inserts.

## CRANKSHAFT OIL SEAL - FRONT

## REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (3) Remove A/C compressor mousing fasteners and set aside.
- (4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Remove upper radiator hose.
- (6) Disconnect electrical connector for fan mounted inside radiator shroud.
- (7) Remove radiator shroud attaching fasteners.

**NOTE:** Transmission cooler line snaps into shroud lower right hand corner.

## CRANKSHAFT OIL SEAL - FRONT (Continued)

(8) Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(9) Remove crankshaft damper bolt.

(10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 61).

80b6b292

**Fig. 61 Crankshaft Damper Removal**

- 1 - SPECIAL TOOL 8513 INSERT  
2 - SPECIAL TOOL 1026

(11) Using Special Tool 8511, remove crankshaft front seal (Fig. 62).

## INSTALLATION

**CAUTION:** To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Using Special Tool 8348 and 8512, install crankshaft front seal (Fig. 63).

(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(4) Install upper radiator hose.

(5) Install A/C compressor and tighten fasteners to 54 N·m (40 ft. lbs.).

(6) Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

80b6b290

**Fig. 62 Crankshaft Front Seal Removal**

- 1 - SPECIAL TOOL 8511

80b76fa1

**Fig. 63 Crankshaft Front Seal Installation**

- 1 - TIMING CHAIN COVER  
2 - SPECIAL TOOL 8348  
3 - SPECIAL TOOL 8512

(7) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(8) Connect negative cable to battery.

## CRANKSHAFT OIL SEAL - REAR

### REMOVAL

**NOTE:** This procedure can be performed in vehicle.

(1) If being performed in vehicle, remove the transmission.

(2) Remove the flexplate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).

**NOTE:** The crankshaft oil seal **CAN NOT** be reused after removal.

**NOTE:** The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

(3) Using Special Tool 8506 (Fig. 64), remove the crankshaft rear oil seal.

**Fig. 64 Crankshaft Rear Oil Seal Removal**

- 1 - REAR CRANKSHAFT SEAL
- 2 - SPECIAL TOOL 8506

### INSTALLATION

(1) Lubricate the crankshaft flange with engine oil.  
 (2) Position the magnetic seal guide Special Tool 8349-2 (Fig. 65) onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

**Fig. 65 Crankshaft Rear Oil Seal Guide Special Tool 8349-2 and Oil**

- 1 - REAR CRANKSHAFT SEAL
- 2 - SPECIAL TOOL 8349-2 GUIDE

(3) Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle (Fig. 66), with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

**Fig. 66 Crankshaft Rear Oil Seal Installation**

- 1 - REAR CRANKSHAFT SEAL
- 2 - SPECIAL TOOL 8349-1 INSTALLER
- 3 - SPECIAL TOOL C-4171 HANDLE

(4) Install the flexplate.  
 (5) Install the transmission.

## FLEX PLATE

### REMOVAL

- (1) Remove the transmission.
- (2) Remove the bolts and flexplate.

### INSTALLATION

- (1) Position the flexplate onto the crankshaft and install the bolts hand tight.
- (2) Tighten the flexplate retaining bolts to 60 N·m (45 ft. lbs.) in the sequence shown (Fig. 67).
- (3) Install the transmission.

**Fig. 67 Flexplate Tightening Sequence**

1 - FLEXPLATE

## PISTON & CONNECTING ROD

### DESCRIPTION

**CAUTION:** Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. The anodized top ring groove and crown has been replaced with a coated top ring that is blue in color on the bottom surface. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The connecting rods are made of forged powdered metal, with a "fractured cap" design. A pressed fit piston pin is used to attach the piston and connecting rod on the 4.7L. The 4.7L HO uses a full floating piston pin.

### STANDARD PROCEDURE—PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 69).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 68). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

80aac2ao

**Fig. 68 DO NOT MEASURE MOLY COATED PISTON**

1 - MOLY COATED  
2 - MOLY COATED

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the following components:
  - Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
  - Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

## PISTON &amp; CONNECTING ROD (Continued)

Fig. 69 BORE GAUGE -TYPICAL

805dd884

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 38 MM  
(1.5 in)

• Timing chain cover (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

• Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

(3) If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

**CAUTION: DO NOT** use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

**NOTE:** Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

(4) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool (Fig. 70).

**CAUTION:** Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

Fig. 70 Identify Connecting Rod to Cylinder Position—Typical

(5) Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

**CAUTION:** Care must be taken not to nick crankshaft journals, as engine damage may occur

(6) Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

(7) Carefully remove piston rings from piston(s), starting from the top ring down.

## CLEANING

**CAUTION: DO NOT** use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

(1) Using a suitable cleaning solvent clean the pistons in warm water and towel dry.

(2) Use a wood or plastic scraper to clean the ring land grooves.

**CAUTION: DO NOT** remove the piston pin from the piston and connecting rod assembly.

## INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

## PISTON &amp; CONNECTING ROD (Continued)

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

## INSTALLATION

(1) Before installing piston and connecting rod assemblies into the bore, install the piston rings.

(2) Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**

(3) Position bearing onto connecting rod. Ensure that hole in bearing shell aligns with hole in connecting rod. Lubricate bearing surface with clean engine oil.

(4) Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads (Fig. 71).

**Fig. 71 PISTON AND CONNECTING ROD INSTALLATION**

- 3 - RING COMPRESSOR
- 4 - SPECIAL TOOL 8507

(5) The pistons are marked on the piston pin bore surface with an raised "F" indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connect-

ing rod oil slinger slot faces the front of the engine (Fig. 72).

808a1f06

**Fig. 72 PISTON AND CONNECTING ROD ORIENTATION**

- 1 - MAJOR THRUST SIDE OF PISTON
- 2 - OIL SLINGER SLOT

(6) Wipe cylinder bore clean and lubricate with engine oil.

(7) Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.

(8) Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

**CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.**

(9) Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) plus 90°.

(10) Install the following components:

- Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- Timing chain and cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## PISTON &amp; CONNECTING ROD (Continued)

- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Fill crankcase with proper engine oil to correct level.

(12) Connect negative cable to battery.

## PISTON RINGS

## STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

- (1) Wipe the cylinder bore clean.
- (2) Insert the ring in the cylinder bore.

**NOTE:** The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

(3) Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.

(4) Using a feeler gauge check the ring end gap (Fig. 73). Replace any rings not within specification.

**Fig. 73 Ring End Gap Measurement - Typical**

1 - FEELER GAUGE

## PISTON RING SIDE CLEARANCE

**NOTE:** Make sure the piston ring grooves are clean and free of nicks and burrs.

(5) Measure the ring side clearance as shown (Fig. 74) make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

(6) Rotate the ring around the piston, the ring must rotate in the groove with out binding.

805dd887

**Fig. 74 Measuring Piston Ring Side Clearance**

1 - FEELER GAUGE

## PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	.051-.094mm (0.0020- .0037 in.)	0.11mm (0.004 in.)
Intermediate Ring	0.04-0.08mm (0.0016-0.0031 in.)	0.10mm (0.004 in.)
Oil Control Ring (Steel Rails)	.019-.229mm (.0007-.0090 in.)	.25mm (0.010 in.)
Ring Position	Ring Gap	Wear Limit
Upper Ring	0.20-0.36mm (0.0079-0.0142 in.)	0.43mm (0.0017 in.)
Intermediate Ring	0.37-0.63mm (0.0146-0.0249 in.)	0.74mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.025-0.76mm (0.0099- 0.03 in.)	1.55mm (0.061 in.)

## PISTON RINGS (Continued)

(7) The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

**NOTE:** Piston rings are installed in the following order:

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(8) Install the oil ring expander.

(9) Install upper side rail (Fig. 75) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

(10) Install No. 2 intermediate piston ring using a piston ring installer (Fig. 76).

(11) Install No. 1 upper piston ring using a piston ring installer (Fig. 76).

(12) Position piston ring end gaps as shown in (Fig. 77). It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

**Fig. 76 Upper and Intermediate Rings—Installation**

## VIBRATION DAMPER

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**NOTE:** Transmission cooler line snaps into shroud lower right hand corner.

- (3) Remove crankshaft damper bolt.
- (4) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 78).

80b6b292

**Fig. 78 CRANKSHAFT DAMPER-REMOVAL**

- 1 - SPECIAL TOOL 8513 INSERT
- 2 - SPECIAL TOOL 1026

### INSTALLATION

**CAUTION:** To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

- (1) Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

**CAUTION:** Special Tool 8512A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

- (2) Assemble Special Tool 8512-A as follows, The nut is threaded onto the shaft first. Then the roller

bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod (Fig. 79). Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

80bce9a4

**Fig. 79 PROPER ASSEMBLY METHOD FOR SPECIAL TOOL 8512-A**

- 1 - BEARING
- 2 - NUT
- 3 - THREADED ROD
- 4 - BEARING HARDENED SURFACE (FACING NUT)
- 5 - HARDENED WASHER

- (3) Using Special Tool 8512A, press damper onto crankshaft (Fig. 80).

80b6b294

**Fig. 80 Crankshaft Damper Installation**

- 1 - SPECIAL TOOL 8512A

## VIBRATION DAMPER (Continued)

(4) Install then tighten crankshaft damper bolt to 175 N·m (130 ft. lbs.).

(5) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Connect negative cable to battery.

## STRUCTURAL COVER

## DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

## OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

## REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove the left hand exhaust pipe from exhaust manifold.
- (3) Loosen the right hand exhaust manifold-to-exhaust pipe retaining bolts.
- (4) Remove the eight bolts retaining structural cover (Fig. 81) in the sequence shown.
- (5) Pivot the exhaust pipe downward and remove the structural cover.

**Fig. 81 Structural Cover**

- 1 - BOLT
- 2 - BOLT
- 3 - BOLT

## INSTALLATION

**CAUTION:** The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

- (1) Position the structural cover in the vehicle.
- (2) Install all four bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time.
- (3) Install the four cover-to-transmission bolts. Do NOT tighten at this time.

**CAUTION:** The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

- (4) Starting with the two rear cover-to-engine bolts, tighten bolts (1) (Fig. 82) to 54 N·m (40 ft. lbs.), then tighten bolts (2) (Fig. 82) and (3) to 54 N·m (40 ft. lbs.) in the sequence shown.

**Fig. 82 Structural Cover**

- 1 - BOLT
- 2 - BOLT
- 3 - BOLT

(5) Install the exhaust pipe on left hand exhaust manifold.

(6) Tighten exhaust manifold-to-exhaust pipe retaining bolts to 20–26 N·m (15–20 ft. lbs.).

## FRONT MOUNT

### REMOVAL

- (1) Disconnect the negative cable from the battery.

**CAUTION:** Remove the fan blade, fan clutch and fan shroud before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.

- (2) Remove the engine oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

- (3) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.

- (4) Remove the four cylinder block-to-insulator mount bolts and the nut from the engine insulator mount through bolt (Fig. 83) (Fig. 84)

**Fig. 83 Engine Insulator Mount 4.7 LEFT**

1 - NUT  
2 - BOLT

- (5) Using the jack, raise the engine high enough to remove the engine insulator mount through bolt and the insulator mount.

**Fig. 84 Engine Insulator Mount 4.7 Right**

1 - NUT  
2 - BOLT

### INSTALLATION

- (1) Position the insulator mount and install the insulator mount through bolt.
- (2) Lower the engine until the four cylinder block-to-insulator mount bolts can be installed.
- (3) Remove the jack and block of wood.
- (4) Torque the cylinder block-to-insulator mount bolts to 61N·m ( 45 ft. lbs.).
- (5) Install and torque the through bolt retaining nut to 61N·m (45 ft. lbs.).

## REAR MOUNT

### REMOVAL

- (1) Raise vehicle on hoist.
- (2) Using a suitable jack, support transmission.
- (3) Remove the lock nut from the insulator mount through bolt and the four insulator-to-transmission mounting bolts.
- (4) Raise the transmission enough to remove the through bolt and insulator mount (Fig. 85) (Fig. 86).

**Fig. 85 Engine Rear Mount—4X2**

ITEM	DESCRIPTION	TORQUE
1	NUT (Qty 1)	45 N·m (33 ft. lbs)
2	BOLT (Qty 4)	46 N·m (34 ft. lbs.)
3	BOLT (Qty 2 Per Side)	68 N·m (50 ft. lbs.)
4	BOLT (Qty 2 Per Side)	46 N·m (34 ft. lbs.)
5	BOLT (Qty 4)	46 N·m (34 ft. lbs.)

**Fig. 86 Engine Rear Mount—4X4**

### INSTALLATION

- (1) Position the insulator mount and install the through bolt.
- (2) Lower the transmission enough to install the four insulator-to-transmission mounting bolts. Torque the bolts to 46N·m (34 ft. lbs.).
- (3) Install the through bolt lock nut. Torque nut to 68N·m (50 ft. lbs.).
- (4) Remove jack, lower vehicle.

## LUBRICATION

### DESCRIPTION

The lubrication system (Fig. 87) is a full flow filtration pressure feed type.

80b3c714

**Fig. 87 Engine Oil Lubrication System**

- |                                    |  |

| 6 - OIL PUMP                       |  |

## LUBRICATION (Continued)

## OPERATION

Oil from the oil pan is pumped by a gerotor type oil pump directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing. For lubrication flow refer to (Fig. 87).

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orientation of the rocker arm, the camshaft intake

lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the number 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. The oil then exits through 1.6mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

ENGINE LUBRICATION FLOW CHART—BLOCK: TABLE 1

** The number three camshaft bearing journal feeds oil into the hollow camshaft tubes. Oil is routed to the intake lobes, which have oil passages drilled into them to lubricate the rocker arms.	

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit (Fig. 88) and install gauge assembly C-3292.

(2) Run engine until thermostat opens.

(3) Oil Pressure:

- Curb Idle—25 Kpa (4 psi) minimum
- 3000 rpm—170 - 550 KPa (25 - 80 psi)

(4) If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

## LUBRICATION (Continued)

Fig. 88 Oil Pressure Sending Unit

- 1 - BELT  
2 - OIL PRESSURE SENSOR  
3 - OIL FILTER  
4 - ELEC. CONNECTOR

## DIAGNOSIS AND TESTING—REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
  - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.
- (4) If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

**CAUTION:** Do not exceed 20.6 kPa (3 psi).

- (5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is

detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION:** Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

## DIAGNOSIS AND TESTING—ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection. **If the oil leak source is not positively identified at this time, proceed with the air leak detection test method.**

### Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

**CAUTION:** Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

## LUBRICATION (Continued)

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

**INSPECTION FOR REAR SEAL AREA LEAKS**

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.**

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

**OIL****STANDARD PROCEDURE - ENGINE OIL**

**WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.**

**ENGINE OIL SPECIFICATION**

**CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.**

**API SERVICE GRADE CERTIFIED**

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

**SAE VISCOSITY**

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30 in the 4.7L engines. **The 4.7L H.O. uses 10W-30 oil only.** These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 89).

**ENERGY CONSERVING OIL**

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

**CONTAINER IDENTIFICATION**

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 90).

## OIL (Continued)

**Fig. 89 Temperature/Engine Oil Viscosity - 4.7L Engine**

9400-9

**Fig. 90 Engine Oil Container Standard Notations**

## OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located on the right side of the the 4.7L engine. (Fig. 91).

80b76f24

**Fig. 91 ENGINE OIL DIPSTICK 4.7L ENGINE**

- 1 - TRANSMISSION DIPSTICK
- 2 - ENGINE OIL DIPSTICK
- 3 - ENGINE OIL FILL CAP

## CRANKCASE OIL LEVEL INSPECTION

**CAUTION:** Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.
- (6) Add oil if level is below the SAFE ZONE on dipstick.

## ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Remove oil fill cap.
- (3) Hoist and support vehicle on safety stands.
- (4) Place a suitable drain pan under crankcase drain.
- (5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
- (6) Install drain plug in crankcase.
- (7) Remove oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (8) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
- (9) Install oil fill cap.
- (10) Start engine and inspect for leaks.
- (11) Stop engine and inspect oil level.

## USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

## OIL FILTER

### REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise (Fig. 92) to remove it from the cylinder block oil filter boss.

80b76f81

**Fig. 92 Oil Filter - 4.7L Engine**

1 - ENGINE OIL FILTER

- (4) When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

**NOTE:** Make sure filter gasket was removed with filter.

- (5) With a wiping cloth, clean the gasket sealing surface of oil and grime.

### INSTALLATION

- (1) Lightly lubricate oil filter gasket with engine oil.
- (2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 93) hand tighten filter one full turn, do not over tighten.
- (3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

**Fig. 93 Oil Filter Sealing Surface-Typical**

1 - SEALING SURFACE  
2 - RUBBER GASKET  
3 - OIL FILTER

## OIL PAN

### DESCRIPTION

The engine oil pan is made of laminated steel and has a single plane sealing surface. The sandwich style oil pan gasket has an integrated windage tray and steel carrier. The sealing area of the gasket is molded with rubber and is designed to be reused as long as the gasket is not cut, torn or ripped.

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise vehicle on hoist.
- (3) Remove structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
- (4) Remove exhaust system Y-pipe.
- (5) Remove starter (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (6) Drain engine oil.
- (7) Un-clip transmission lines from support on oil pan stud. Move lines for oil pan clearance.

**CAUTION:** DO NOT pry on the oil pan gasket when removing the oil pan. The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when lowering oil pan. Gasket can not be removed with oil pan.

- (8) Remove oil pan bolts and oil pan.
- (9) Remove oil pump pickup tube.
- (10) Remove oil pan gasket.

### CLEANING

- (1) Clean oil pan in solvent and wipe dry with a clean cloth.
- (2) Clean the oil pan gasket surface. **DO NOT** use a grinder wheel or other abrasive tool to clean sealing surface.

## OIL PAN (Continued)

(3) Clean oil screen and tube thoroughly in clean solvent.

## INSPECTION

(1) Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

(2) Inspect the oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

## INSTALLATION

(1) Clean oil pan and all sealing surfaces. Inspect oil pan gasket and replace as necessary.

(2) Install oil pan gasket.

**NOTE:** When installing oil pan gasket/windage tray, start four pan bolts at each corner before tightening oil pickup tube. This will keep pan gasket in alignment.

(3) Install oil pump pick-up tube using a new O-ring. First tighten bolt at O-ring end of tube to 28 N·m (20 ft. lbs.). Tighten remain tube support fasteners to 28 N·m (20 ft. lbs.).

(4) Install oil pan and tighten fasteners to 15 N·m (11 ft. lbs.) (Fig. 94).

**Fig. 94 Oil Pan Tightening Sequence**

(5) Reconnect transmission oil cooler lines to oil pan stud bolt.

(6) Install starter (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(7) Install exhaust system Y-pipe.

(8) Install structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(9) Lower vehicle.

(10) Fill engine with proper amount of oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(11) Connect negative cable to battery.

OIL PRESSURE SENSOR/  
SWITCH

## DESCRIPTION

The 3-wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

## OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

## REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise vehicle on hoist.
- (3) Remove front splash shield.
- (4) Disconnect oil pressure sender wire (Fig. 95).
- (5) Remove the pressure sender (Fig. 95).

## OIL PRESSURE SENSOR/SWITCH (Continued)

**Fig. 95 Oil Pressure Sending Unit**

- 1 - BELT
- 2 - OIL PRESSURE SENSOR
- 3 - OIL FILTER
- 4 - ELEC. CONNECTOR

**INSTALLATION**

- (1) Install oil pressure sender.
- (2) Connect oil pressure sender wire.
- (3) Install front splash shield.
- (4) Lower vehicle.
- (5) Connect the negative battery cable.

**OIL PUMP****REMOVAL**

- (1) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (3) Remove the timing chains and tensioners (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
- (4) Remove the four bolts, primary timing chain tensioner and the oil pump.

**DISASSEMBLY**

- (1) Remove oil pump cover screws and lift off cover plate.
- (2) Remove pump inner and outer rotors.

**NOTE:** Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.

- (3) If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

**CLEANING**

- (1) Wash all parts in a suitable solvent.

**INSPECTION**

**CAUTION:** Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

- (1) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.

- (2) Lay a straight edge across the pump cover surface (Fig. 96). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between the cover and the straight edge the oil pump assembly should be replaced.

- (3) Measure the thickness of the outer rotor (Fig. 97). If the outer rotor thickness measures at 12.005 mm (0.472 in.) or less the oil pump assembly must be replaced.

- (4) Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.925 mm (3.382 in.) or less the oil pump assembly must be replaced.

- (5) Measure the thickness of the inner rotor (Fig. 98). If the inner rotor thickness measures at 12.005 mm (0.472 in.) or less then the oil pump assembly must be replaced.

- (6) Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body (Fig. 99). If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

- (7) Install the inner rotor in the into the oil pump body. Measure the clearance between the inner and outer rotors (Fig. 100). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

- (8) Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced (Fig. 101).

## OIL PUMP (Continued)

**NOTE:** The 3.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

9309-184

- 3 - OIL PUMP COVER

9309-69

**Fig. 97 Measuring Outer Rotor Thickness**

## ASSEMBLY

- (1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.
- (2) Install inner and outer rotors
- (3) Install oil pump cover plate and install cover bolts and tighten them to 12 N·m (105 in. lbs.).
- (4) Prime oil pump before installation by filling rotor cavity with engine oil.
- (5) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

9309-70

**Fig. 98 Measuring Inner Rotor Thickness**

## INSTALLATION

- (1) Position the oil pump onto the crankshaft and install one oil pump retaining bolts.
- (2) Position the primary timing chain tensioner and install three retaining bolts.
- (3) Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N·m (250 in. lbs.) in the sequence shown (Fig. 102).
- (4) Install the secondary timing chain tensioners and timing chains (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
- (5) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

## INTAKE MANIFOLD

### DESCRIPTION

The intake manifold is made of a composite material and features long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of eight individual press in

**Fig. 102 Oil Pump And Primary Timing Chain Tensioner Tightening Sequence**

place port gaskets to prevent leaks. Eight studs and two bolts are used to fasten the intake to the head.

### DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.**

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPM is observed the area of the suspected leak has been found.
- (4) Repair as required.

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove air cleaner housing and throttle body resonator (Fig. 103).
- (3) Disconnect throttle and speed control cables.
- (4) Disconnect electrical connectors for the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Intake Air Temperature (IAT) Sensor
  - Throttle Position (TPS) Sensor

## INTAKE MANIFOLD (Continued)

**Fig. 103 Throttle Body Resonator**

- 1 - THROTTLE BODY RESONATOR  
2 - BOLT  
3 - BOLT

- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor

(5) Disconnect vapor purge hose, brake booster hose, speed control servo hose, positive crankcase ventilation (PCV) hose.

(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Disconnect generator electrical connections.

(8) Unbolt the generator and move it away from the intake manifold for clearance.

(9) Disconnect air conditioning compressor electrical connections.

(10) Unbolt the air conditioning compressor and move it away from the intake manifold for clearance.

(11) Disconnect left and right radio suppressor straps.

(12) Disconnect and remove ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL).

(13) Remove top oil dipstick tube retaining bolt and ground strap.

(14) Bleed pressure from fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(15) Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).

(16) Remove throttle body assembly and mounting bracket.

(17) Drain cooling system below coolant temperature level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(18) Remove coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - REMOVAL).

(19) Remove cowl to hood seal. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/COWL WEATHERSTRIP - REMOVAL).

(20) Remove right side engine lifting stud.

(21) Remove intake manifold retaining fasteners, in reverse order of tightening sequence (Fig. 104).

**NOTE:** Intake must be lifted upward and level in the front and rear to clear the cowl. Interference with the cowl will occur during removal.

(22) Remove intake manifold.

**Fig. 104 Intake Manifold Tightening Sequence****CLEANING**

**NOTE:** There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

**INSPECTION**

(1) Inspect the intake sealing surface for cracks, nicks and distortion.

(2) Inspect the intake manifold vacuum hose fittings for looseness or blockage.

(3) Inspect the manifold to throttle body mating surface for cracks, nicks and distortion.

**INSTALLATION**

(1) Install intake manifold gaskets.

(2) Install intake manifold.

## INTAKE MANIFOLD (Continued)

(3) Install intake manifold retaining bolts and tighten in sequence shown in (Fig. 105) to 12 N·m (105 in. lbs.).

**Fig. 105 Intake Manifold Tightening Sequence**

- (4) Install left and right radio suppressor straps.
- (5) Install throttle body assembly.
- (6) Install throttle cable bracket.
- (7) Connect throttle cable and speed control cable to throttle body.
- (8) Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).
- (9) Install ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION).
- (10) Install coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - INSTALLATION).
- (11) Connect electrical connectors for the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Intake Air Temperature (IAT) Sensor
  - Throttle Position (TPS) Sensor
  - Coolant Temperature (CTS) Sensor
  - Idle Air Control (IAC) Motor
  - Ignition coil towers
  - Fuel injectors
- (12) Install top oil dipstick tube retaining bolt and ground strap.
- (13) Install right side engine lifting stud.
- (14) Install generator including electrical connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
- (15) Connect Vapor purge hose, Brake booster hose, Speed control servo hose, Positive crankcase ventilation (PCV) hose.
- (16) Install air conditioning compressor including electrical connections.

(17) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(18) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(19) Install cowl to hood seal (Refer to 23 - BODY/WEATHERSTRIP/SEALS/COWL WEATHERSTRIP - INSTALLATION).

(20) Install air cleaner housing and throttle body resonator. Tighten resonator bolts 4.5 N·m (40 in. lbs.).

(21) Connect negative cable to battery.

## EXHAUST MANIFOLD - LEFT

### DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

### REMOVAL

- (1) Disconnect negative cable for battery.
- (2) Hoist vehicle.
- (3) Disconnect exhaust pipe at manifold.
- (4) Lower vehicle.
- (5) Remove air cleaner housing and tube.
- (6) Remove the front two exhaust heat shield retaining fasteners. Raise vehicle and remove the fasteners at rear of heat shield.
- (7) Remove heat shield (Fig. 106).
- (8) Lower vehicle and remove the upper exhaust manifold retaining bolts (Fig. 106).
- (9) Raise vehicle and remove the lower exhaust manifold retaining bolts (Fig. 106).
- (10) Remove exhaust manifold and gasket (Fig. 106). Manifold is removed from below the engine compartment.

### CLEANING

- (1) Clean the exhaust manifold using a suitable cleaning solvent, then allow to air dry.
- (2) Clean all gasket residue from the manifold mating surface.

### INSPECTION

- (1) Inspect the exhaust manifold for cracks in the mating surface and at every mounting bolt hole.

## EXHAUST MANIFOLD - LEFT (Continued)

80b3b29a

**Fig. 106 Exhaust Manifold—Left**

ITEM	DESCRIPTION	TORQUE	ITEM	DESCRIPTION	TORQUE
1	Stud (Qty 2)		4	Nut (Qty 2)	8 N-m (72 in. lbs.), then loosen 45 degrees
2	Bolt (Qty 4)	25 N-m (18 ft. lbs.)	5	Nut (Qty 2)	
3	Stud (Qty 2)				

(2) Using a straight edge and a feeler gauge, check the mating surface for warp and twist.

(3) Inspect the manifold to exhaust pipe mating surface for cracks, gouges, or other damage that would prevent sealing.

**INSTALLATION**

(1) Install exhaust manifold and gasket from below engine compartment.

(2) Install lower exhaust manifold fasteners (Fig. 106). DO NOT tighten until all fasteners are in place.

(3) Lower vehicle and install upper exhaust manifold fasteners (Fig. 106). Tighten all manifold bolts

starting at center and working outward to 25 N-m (18 ft. lbs.).

**CAUTION:** Over tightening heat shield fasteners, may cause shield to distort and/or crack.

(4) Install exhaust manifold heat shield (Fig. 106). Tighten fasteners to 8 N-m (72 in. lbs.), then loosen 45 degrees.

(5) Install air cleaner housing and tube.

(6) Connect exhaust pipe to manifold.

(7) Connect negative cable to battery.

## EXHAUST MANIFOLD - RIGHT

### DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

### REMOVAL

- (1) Disconnect negative cable for battery.
- (2) Remove battery from vehicle.
- (3) Remove Power Distribution Center (PDC) fasteners and set aside.
- (4) Remove battery tray assembly.
- (5) Remove washer bottle assembly.
- (6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (7) Remove A/C compressor from mounting and set aside.
- (8) Remove A/C accumulator support bracket fastener.
- (9) Drain coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (10) Remove heater hoses at engine.
- (11) Remove fasteners attaching exhaust manifold heat shield (Fig. 107).
- (12) Remove heat shield (Fig. 107).
- (13) Remove upper exhaust manifold attaching fasteners (Fig. 107).
- (14) Raise vehicle on hoist.
- (15) Disconnect exhaust pipe from manifold.
- (16) Remove fasteners attaching starter. Move starter aside.
- (17) Remove lower exhaust manifold attaching fasteners.
- (18) Remove exhaust manifold and gasket (Fig. 107). Manifold is removed from below the engine compartment.

### CLEANING

- (1) Clean the exhaust manifold using a suitable cleaning solvent, then allow to air dry.
- (2) Clean all gasket residue from the manifold mating surface.

### INSPECTION

- (1) Inspect the exhaust manifold for cracks in the mating surface and at every mounting bolt hole.
- (2) Using a straight edge and a feeler gauge, check the mating surface for warp and twist.
- (3) Inspect the manifold to exhaust pipe mating surface for cracks, gouges, or other damage that would prevent sealing.

### INSTALLATION

- (1) Install exhaust manifold and gasket from below engine compartment.
- (2) Install lower exhaust manifold fasteners. DO NOT tighten until all fasteners are in place.
- (3) Lower vehicle and install upper exhaust manifold fasteners. Tighten all manifold bolts starting at center and working outward to 25 N·m (18 ft. lbs.).

**CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.**

- (4) Install exhaust manifold heat shield. Tighten fasteners to 8 N·m (72 in. lbs.), then loosen 45 degrees.
- (5) Install starter and fasteners.
- (6) Connect exhaust pipe to manifold.
- (7) Connect heater hoses at engine.
- (8) Install fastener attaching A/C accumulator.
- (9) Install A/C compressor and fasteners.
- (10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (11) Install washer bottle and battery tray assembly.
- (12) Install PDC.
- (13) Install battery and connect cables.
- (14) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

## VALVE TIMING

### DESCRIPTION - TIMING DRIVE SYSTEM

The timing drive system has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain and two secondary timing chain drives (Fig. 108).

### OPERATION - TIMING DRIVE SYSTEM

The primary timing chain is a single inverted tooth type. The primary chain drives the large fifty tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary

chain receives oil splash lubrication from the secondary chain drive and oil pump leakage. The idler sprocket assembly connects the primary and secondary chain drives. The idler sprocket assembly consists of two integral thirty tooth sprockets and a fifty tooth sprocket that is splined to the assembly. The spline joint is a non - serviceable press fit anti rattle type. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

There are two secondary drive chains, both are inverted tooth type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a thirty tooth cam sprocket

80b3c710

**Fig. 108 Timing Drive System**

## VALVE TIMING (Continued)

directly from the thirty tooth sprocket on the idler sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

## STANDARD PROCEDURE

## STANDARD PROCEDURE - ENGINE TIMING - VERIFICATION

**CAUTION:** The 4.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.

**NOTE:** Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.

**NOTE:** The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.

Engine base timing can be verified by the following procedure:

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Using a mirror, locate the TDC arrow on the front cover (Fig. 109). Rotate the crankshaft until the mark on the crankshaft damper is aligned with the TDC arrow on the front cover. The engine is now at TDC.

(3) Note the location of the V8 mark stamped into the camshaft drive gears (Fig. 110). If the V8 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC (cylinder #1) on the exhaust stroke. If the V8 mark on each gear is at the six o'clock position, the engine is at TDC (cylinder #1) on the compression stroke.

**Fig. 109 Engine Top Dead Center (TDC) Indicator Mark**

- 1 - TIMING CHAIN COVER  
2 - CRANKSHAFT TIMING MARKS

(4) If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to Timing Chain and Sprockets procedure in this section.

(5) If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one secondary chain. Refer to Single camshaft timing, in this procedure.

(6) If both camshaft drive gear V8 marks are at the twelve o'clock or the six o'clock position the engine base timing is correct. Reinstall the cylinder head covers.

## SINGLE CAMSHAFT TIMING

**NOTE:** to adjust the timing on one camshaft, perform the following procedure.

(1) Using Chain Tensioner Wedge, special tool 8350, stabilize the secondary chain drive (Fig. 111). For reference purposes, mark the chain-to-sprocket position (Fig. 111).

(2) Remove the camshaft drive gear retaining bolt.

(3) Carefully remove the camshaft drive gear from the camshaft.

(4) Re-index the camshaft drive gear in the chain until the V8 mark is at the same position as the V8 mark on the opposite camshaft drive gear.

3 - SPECIAL TOOL 8350 WEDGE  
4 - SPECIAL TOOL 8350 WEDGE

## VALVE TIMING (Continued)

**NOTE:** When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

(5) Using a suitable pair of adjustable pliers, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear (Fig. 112).

**Fig. 112 Camshaft Dowel**

- 1 - ADJUSTABLE PLIERS
- 2 - CAMSHAFT DOWEL

**CAUTION:** Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

(6) Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten retaining bolt to 122N·m (90 ft. Lbs.) (Fig. 113) (Fig. 114).

(7) Remove special tool 8350.

(8) Rotate the crankshaft two full revolutions, then reverify that the camshaft drive gear V8 marks are in fact aligned.

(9) Install the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

**Fig. 113 Camshaft Sprocket Left Cylinder Head**

- 1 - TORQUE WRENCH
- 2 - CAMSHAFT SPROCKET
- 3 - LEFT CYLINDER HEAD
- 4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

## STANDARD PROCEDURE—MEASURING TIMING CHAIN WEAR

**NOTE:** This procedure must be performed with the timing chain cover removed.

(1) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston (Fig. 115). The measurement at point (A) must be less than 15mm (0.5906 inches).

(3) If the measurement exceeds the specification the secondary timing chains are worn and require replacement. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

**Fig. 115 Measuring Secondary Timing Chains For Wear**

- 1 - SECONDARY TENSIONER ARM
- 2 - SECONDARY CHAIN TENSIONER PISTON

**NOTE:** If the secondary chains are to be replaced the primary chain must also be replaced.

## TIMING BELT / CHAIN COVER(S)

## REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Disconnect both heater hoses at timing cover.
- (4) Disconnect lower radiator hose at engine.
- (5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (6) Remove accessory drive belt tensioner assembly (Fig. 116).

**Fig. 116 Accessory Drive Belt Tensioner**

- 1 - TENSIONER ASSEMBLY
- 2 - FASTENER TENSIONER TO FRONT COVER

- (7) Remove the generator and A/C compressor.

**CAUTION:** The 4.7L engine uses an RTV sealer instead of a gasket to seal the front cover to the engine block, from the factory. For service, Mopar® Engine RTV sealant must be substituted.

**NOTE:** It is not necessary to remove the water pump for timing cover removal.

- (8) Remove the bolts holding the timing cover to engine block. (Fig. 117).
- (9) Remove cover (Fig. 117).

## TIMING BELT / CHAIN COVER(S) (Continued)

★ INDICATES STUD LOCATIONS

Fig. 117 Timing Chain Cover Fasteners

## INSTALLATION

**CAUTION:** Do not use oil based liquids to clean timing cover or block surfaces. Use only rubbing alcohol, along with plastic or wooden scrapers. Use no wire brushes or abrasive wheels or metal scrapers, or damage to surfaces could result.

(1) Clean timing chain cover and block surface using rubbing alcohol.

**CAUTION:** The 4.7L uses a special RTV sealer instead of a gasket to seal the timing cover to the engine block, from the factory. For service repairs, Mopar® Engine RTV must be used as a substitute.

(2) Inspect the water passage o-rings for any damage, and replace as necessary.

(3) Apply Mopar® Engine RTV sealer to the front cover following the path below, using a 3 to 4mm thick bead (Fig. 118).

(4) Install cover. Tighten flange head fasteners in sequence as shown in (Fig. 119) to 58 N-m (43 ft. lbs.).

(5) Install the A/C compressor and generator.

(6) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(7) Install accessory drive belt tensioner assembly. Tighten fastener to 54 N-m (40 ft. lbs.).

(8) Install lower radiator hose.

(9) Install both heater hoses.

(10) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(11) Connect the battery negative cable.

## TIMING BELT/CHAIN AND SPROCKETS

### REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove right and left cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (4) Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (5) Rotate engine until timing mark on crankshaft damper aligns with TDC mark on timing chain cover (Fig. 120) (#1 cylinder exhaust stroke) and the camshaft sprocket "V8" marks are at the 12 o'clock position (Fig. 121).

**Fig. 120 Engine Top Dead Center (TDC) Indicator Mark**

- 1 - TIMING CHAIN COVER  
2 - CRANKSHAFT TIMING MARKS

- (6) Remove power steering pump.
- (7) Remove access plugs (2) from left and right cylinder heads for access to chain guide fasteners (Fig. 122).
- (8) Remove the oil fill housing to gain access to the right side tensioner arm fastener.
- (9) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (10) Collapse and pin primary chain tensioner (Fig. 123).

**CAUTION:** Plate behind left secondary chain tensioner could fall into oil pan. Therefore, cover pan opening.

- (11) Remove secondary chain tensioners.
- (12) Remove camshaft position sensor from right cylinder head (Fig. 124).

**CAUTION:** Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.

**CAUTION:** Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur. Ensure negative battery cable is disconnected to guard against accidental starter engagement.

- 1 - CAMSHAFT SPROCKET AND CHAIN
- 2 - ADJUSTABLE PLIERS
- 3 - CAMSHAFT

(13) Remove left and right camshaft sprocket bolts.

(14) While holding the left camshaft steel tube with adjustable pliers, (Fig. 125) remove the left camshaft sprocket. Slowly rotate the camshaft approximately 15 degrees clockwise to a neutral position.

(15) While holding the right camshaft steel tube with adjustable pliers, (Fig. 126) remove the right camshaft sprocket. Slowly rotate the camshaft approximately 45 degrees counterclockwise to a neutral position.

(16) Remove idler sprocket assembly bolt.

(17) Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.

(18) Remove both pivoting tensioner arms and chain guides.

(19) Remove chain tensioner.

80ba7755

- 2 - CAMSHAFT DOWEL

## TIMING BELT/CHAIN AND SPROCKETS (Continued)

## INSPECTION

Inspect the following components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.
- secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner and tensioner arm should be replaced.

- Primary chain tensioner plastic faces. Replace as required (Fig. 127).

## INSTALLATION

(1) Using a vise, lightly compress the secondary chain tensioner piston until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner body. Install Special Tool 8514 lock pin into hole on front of tensioner. Slowly open vise to transfer piston spring force to lock pin (Fig. 128).

(2) Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N·m (250 in. lbs.).

80b3c710

## TIMING BELT/CHAIN AND SPROCKETS (Continued)

**Fig. 128 Resetting Secondary Chain Tensioners**

- 1 - VISE
- 2 - INSERT LOCK PIN
- 3 - RATCHET PAWL
- 4 - RATCHET
- 5 - PISTON

**CAUTION:** Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(3) Install right side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

**NOTE:** The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.

(4) Install the left side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

**CAUTION:** Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(5) Install left side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

(6) Install the right side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

(7) Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position

special tool 8515 to hold chains in place for installation (Fig. 129).

(8) Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket (Fig. 127).

**Fig. 129 Installing Secondary Timing Chains on Idler Sprocket**

- 1 - LOCK ARM
- 2 - RIGHT CAMSHAFT CHAIN
- 3 - SECONDARY CHAINS RETAINING PINS (4)
- 4 - IDLER SPROCKET
- 5 - LEFT CAMSHAFT CHAIN
- 6 - SPECIAL TOOL 8515

(9) Lubricate idler shaft and bushings with clean engine oil.

(10) Install all chains, crankshaft sprocket, and idler sprocket as an assembly (Fig. 130). After guiding both secondary chains through the block and cylinder head openings, affix chains with an elastic strap or the equivalent. This will maintain tension on chains to aid in installation.

**NOTE:** It will be necessary to slightly rotate camshafts for sprocket installation.

(11) Align left camshaft sprocket "L" dot to plated link on chain.

(12) Align right camshaft sprocket "R" dot to plated link on chain.

**CAUTION:** Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in over-torque of bolt resulting in bolt failure.

## TIMING BELT/CHAIN AND SPROCKETS (Continued)

**Fig. 130 Installing Idler Gear, Primary and Secondary Timing Chains**

- 1 - SPECIAL TOOL 8515
- 2 - PRIMARY CHAIN IDLER SPROCKET
- 3 - CRANKSHAFT SPROCKET

(13) Remove Special Tool 8515, then attach both sprockets to camshafts. Remove excess oil from bolts, then install sprocket bolts, but do not tighten at this time.

(14) Verify that all plated links are aligned with the marks on all sprockets and the "V8" marks on camshaft sprockets are at the 12 o'clock position (Fig. 127).

**CAUTION:** Ensure the plate between the left secondary chain tensioner and block is correctly installed.

(15) Install both secondary chain tensioners. Tighten bolts to 28 N·m (250 in. lbs.).

**NOTE:** Left and right secondary chain tensioners are not common.

(16) Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N·m (25 ft. lbs.).

(17) Remove all locking pins (3) from tensioners.

**CAUTION:** After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.

(18) Using Special Tool 6958, Spanner with Adapter Pins 8346, tighten left (Fig. 131) and right (Fig. 132). camshaft sprocket bolts to 122 N·m (90 ft. lbs.).

**Fig. 131 Tightening Left Side Camshaft Sprocket Bolt**

- 1 - TORQUE WRENCH
- 2 - CAMSHAFT SPROCKET
- 3 - LEFT CYLINDER HEAD
- 4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

(19) Rotate engine two full revolutions. Verify timing marks are at the following locations:

- primary chain idler sprocket dot is at 12 o'clock (Fig. 127)
- primary chain crankshaft sprocket dot is at 6 o'clock (Fig. 127)
- secondary chain camshaft sprockets "V8" marks are at 12 o'clock (Fig. 127)

(20) Lubricate all three chains with engine oil.

(21) After installing all chains, it is recommended that the idler gear end play be checked (Fig. 133). The end play must be within 0.10–0.25 mm (0.004–0.010 in.). If not within specification, the idler gear and idler shaft must be replaced.

(22) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) and crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(23) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## TIMING BELT/CHAIN AND SPROCKETS (Continued)

**Fig. 132 Tightening Right Side Camshaft Sprocket Bolt**

- 1 - TORQUE WRENCH
- 2 - SPECIAL TOOL 6958 WITH ADAPTER PINS 8346
- 3 - LEFT CAMSHAFT SPROCKET
- 4 - RIGHT CAMSHAFT SPROCKET

**Fig. 133 Measuring Idler Gear End Play**

- 1 - IDLER SPROCKET ASSEMBLY
- 2 - DIAL INDICATOR

**NOTE:** Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.

(24) Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon**, then install

into the right cylinder head and tighten to 81 N·m (60 ft. lbs.) (Fig. 122).

(25) Install the oil fill housing.

(26) Install access plug in left cylinder head (Fig. 122).

(27) Install power steering pump.

(28) Install radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(29) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(30) Connect negative cable to battery.

## IDLER SHAFT

### REMOVAL

(1) Remove the primary and secondary timing chains and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL) .

**NOTE:** To remove the idler shaft, it is necessary to tap threads into the shaft, to install the removal tool.

(2) Using a 12 mm X 1.75 tap, cut threads in the idler shaft center bore.

(3) Cover the radiator core with a suitable cover.

**CAUTION:** Use care when removing the idler shaft, Do not strike the radiator cooling fins with the slide hammer.

(4) Using Special Tool 8517 Slide Hammer, remove the idler shaft.

### INSTALLATION

(1) Thoroughly clean the idler shaft bore.

(2) Position the idler shaft in the bore.

**NOTE:** The two lubrication holes in the idler shaft do not require any special alignment.

**NOTE:** Before using the retaining bolt to install the idler shaft, coat the threads and the pilot on the idler shaft, with clean engine oil.

(3) Using the primary idler sprocket retaining bolt and washer, carefully draw the idler shaft into the bore until fully seated.

(4) Coat the idler shaft with clean engine oil.

(5) Install the timing chains and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

EXHAUST SYSTEM

DESCRIPTION - EXHAUST SYSTEM

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

**CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.**

The exhaust system uses a single muffler with a welded tailpipe.

The 50 State Emissions vehicles use two mini catalytic converters inline with the exhaust pipe below the exhaust manifolds.

The exhaust manifolds are equipped with ball flange outlets to assure a tight seal and strain free connections.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises originating from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

The basic exhaust system consists of exhaust manifold(s), exhaust pipe with oxygen sensors, catalytic converter(s), heat shield(s), muffler and tailpipe (Fig. 1) and (Fig. 2).

## EXHAUST SYSTEM (Continued)

## DIAGNOSIS AND TESTING - EXHAUST SYSTEM

## EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE	1. Leaks at pipe joints.  2. Burned or blown out muffler.  3. Burned or rusted-out exhaust pipe.  4. Exhaust pipe leaking at manifold flange.  5. Exhaust manifold cracked or broken.  6. Leak between exhaust manifold and cylinder head.  7. Restriction in muffler or tailpipe.  8. Exhaust system contacting body or chassis.	1. Tighten clamps to specified torque at leaking joints (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).  2. Replace muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL). Check exhaust system.  3. Replace exhaust pipe (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL).  4. Tighten connection attaching nuts (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).  5. Replace exhaust manifold (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).  6. Tighten exhaust manifold to cylinder head stud nuts or bolts (Refer to 9 - ENGINE - SPECIFICATIONS).  7. Remove restriction, if possible. Replace muffler or tailpipe, as necessary.  8. Re-align exhaust system to clear surrounding components.
LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten/replace clamps at leaking joints (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).

## CATALYTIC CONVERTER - 4.0L

## DESCRIPTION - CATALYTIC CONVERTER - 4.0L ENGINE

**WARNING:** THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

**CAUTION:** DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

**Unleaded gasoline must be used to avoid contaminating the catalyst core.**

50 State emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter (Fig. 3).

## REMOVAL

**WARNING:** IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

Fig. 3 4.0L Catalytic Converter and O2 Sensor Configuration - 50 State Emissions

## CATALYTIC CONVERTER - 4.0L (Continued)

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove nuts from the catalytic converter and exhaust pipe flange connection (Fig. 4).
- (4) Loosen exhaust clamp from the catalytic converter and muffler connection (Fig. 4).
- (5) Disconnect oxygen sensor wiring (Fig. 4).

**Fig. 4 Exhaust Pipe-to-Catalytic Converter-to-Muffler Connection**

- 1 - EXHAUST CLAMP ASSEMBLY
- 2 - OXYGEN SENSOR
- 3 - MUFFLER
- 4 - CATALYTIC CONVERTER
- 5 - EXHAUST PIPE WITH FLANGE JOINT
- 6 - NUTS (3)

- (6) Heat the catalytic converter to muffler connection with a torch until the metal becomes cherry red.
- (7) While the metal is still cherry red, twist the catalytic converter back and forth to separate it from the exhaust pipe and the muffler (Fig. 5).

## INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

808c339c

**Fig. 5 Catalytic Converter - Removal**

- 1 - EXHAUST PIPE WITH FLANGE
- 2 - NUTS (3)
- 3 - CATALYTIC CONVERTER

## INSTALLATION

- (1) Position the catalytic converter onto the exhaust pipe flange connection (Fig. 4). Tighten the nuts to 28 N·m (250 in. lbs.) torque.
- (2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.
- (3) Install the exhaust clamp at the muffler and catalytic converter connection (Fig. 4). Tighten the clamp nuts to 47 N·m (35 ft. lbs.) torque.
- (4) Connect oxygen sensor wiring (Fig. 4).
- (5) Lower the vehicle.
- (6) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
- (7) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

## CATALYTIC CONVERTER - 4.7L

### DESCRIPTION - CATALYTIC CONVERTER

**WARNING:** THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

**CAUTION:** DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

**Unleaded gasoline must be used to avoid contaminating the catalyst core.**

50 State emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter (Fig. 6).

### REMOVAL

**WARNING:** IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

Fig. 6 4.7L Catalytic Converter and O2 Sensor Configuration - 50 State Emissions

## CATALYTIC CONVERTER - 4.7L (Continued)

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove nuts from the catalytic converter and exhaust pipe flange connection (Fig. 7).
- (4) Loosen exhaust clamp from the catalytic converter and muffler connection (Fig. 7).
- (5) Disconnect oxygen sensor wiring (Fig. 7).

- (6) Heat the catalytic converter to muffler connection with a torch until the metal becomes cherry red.
- (7) While the metal is still cherry red, twist the catalytic converter back and forth to separate it from the muffler (Fig. 8).

## INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

808c339c

**Fig. 8 Catalytic Converter - Removal**

- 1 - EXHAUST PIPE WITH FLANGE
- 2 - NUTS (3)
- 3 - CATALYTIC CONVERTER

## INSTALLATION

(1) Position the catalytic converter onto the exhaust pipe flange connection (Fig. 7). Tighten the nuts to 28 N·m (250 in. lbs.) torque.

(2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.

(3) Install the exhaust clamp at the muffler and catalytic converter connection (Fig. 7). Tighten the clamp nuts to 47 N·m (35 ft. lbs.) torque.

(4) Connect oxygen sensor wiring (Fig. 7).

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(7) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

## EXHAUST PIPE - 4.0L

## REMOVAL

**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

- (1) Raise and support the vehicle.

- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

- (3) Remove the oxygen sensor from the exhaust pipe (Fig. 9).

- (4) Remove the nuts from the exhaust pipe to catalytic converter flange connection (Fig. 10).

- (5) Disconnect the exhaust pipe from the exhaust manifold (Fig. 11).

## INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

## INSTALLATION

- (1) Connect the exhaust pipe to the engine exhaust manifold. Tighten the nuts to 31 N·m (23 ft. lbs.) (Fig. 11).

Fig. 9 O2 Sensor Location 4.0L

- 5 - MINI CATALYTIC CONVERTER
- 6 - BOLT

**NOTE:** When servicing the exhaust system, replace the factory installed uni-clamp with standard u-bolt clamps.

(2) Position the catalytic converter onto the exhaust pipe flange connection. Tighten retaining nuts to 28 N·m (250 in. lbs.) (Fig. 12).

(3) Coat the oxygen sensor with anti-seize compound. Install the sensor and tighten the nut to 48 N·m (35 ft. lbs.) torque (Fig. 9).

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(6) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

(7) After initial start-up, check the engine exhaust manifold to exhaust pipe nuts for proper torque.

## EXHAUST PIPE - 4.7L

## REMOVAL

**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

- (1) Raise and support the vehicle.

- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

- (3) Remove the oxygen sensor from the exhaust pipe (Fig. 13).

- (4) Remove the retaining nuts holding catalytic converter to exhaust pipe (Fig. 14).

- (5) Disconnect the exhaust pipe from the exhaust manifold. (Fig. 15)

## INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

## INSTALLATION

- (1) Connect the exhaust pipe to the engine exhaust manifold. Tighten the nuts (A) to 31 N·m (23 ft. lbs.) (Fig. 15).

Fig. 13 4.7L Catalytic Converter and O2 Sensor Configuration - 50 State Emissions

- A - NUTS (4)
- 3 - EXHAUST PIPE
- B - BOLTS (4)

**NOTE:** When servicing the exhaust system, replace the factory installed uni-clamp with standard u-bolt clamps.

(2) Position the catalytic converter onto the exhaust pipe flange connection. Tighten retaining nuts to 28 N·m (250 in. lbs.). (Fig. 16)

(3) Coat the oxygen sensor with anti-seize compound. Install the sensor and tighten the nut to 48 N·m (35 ft. lbs.) torque (Fig. 13).

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(6) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

(7) After initial start-up, check the engine exhaust manifold to exhaust pipe nuts for proper torque.

## HEAT SHIELDS

### DESCRIPTION

Heat shields are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The catalytic converter releases additional heat into the exhaust system. Under severe operating conditions, the temperature increases in the area of the converter. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency (Fig. 17).

- 1 - REAR FLOOR PAN HEAT SHIELD
- 2 - HEAT SHIELD RETAINING NUTS (QTY 8)
- 3 - FRONT FLOOR PAN HEAT SHIELD

## MUFFLER

### DESCRIPTION

Both the 4.0L and 4.7L engines use a stainless steel muffler to control exhaust noise levels and exhaust back pressure. The muffler and tailpipe are a one piece assembly (Fig. 18).

### REMOVAL

All original equipment exhaust systems are manufactured with the tailpipe welded to the muffler. Service replacement mufflers and tailpipes are either clamped together or welded together.

**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

808c335a

**Fig. 18 Muffler and Tailpipe**

- 1 - CATALYTIC CONVERTER
- 2 - TAILPIPE HANGER
- 3 - TAILPIPE
- 4 - MUFFLER

(3) Loosen the exhaust clamp on the catalytic converter to muffler connection (Fig. 19).

808c33b3

**Fig. 19 Installing Exhaust Clamps**

- 1 - CATALYTIC CONVERTER
- 2 - MUFFLER

## MUFFLER (Continued)

(4) Heat the catalytic converter-to-muffler connection with a torch until the metal becomes cherry red.

(5) While the metal is still cherry red, remove the tailpipe/muffler assembly from the catalytic converter.

(6) Remove the tailpipe from the tailpipe hanger (Fig. 20).

(7) Remove the tailpipe/muffler assembly (Fig. 20).

808c335a

**Fig. 20 Muffler and Tailpipe**

- 1 - CATALYTIC CONVERTER
- 2 - TAILPIPE HANGER
- 3 - TAILPIPE
- 4 - MUFFLER

## INSTALLATION

(1) If the tailpipe hanger assembly was removed, install the hanger to the frame. Tighten the bolts to 22 N·m (192 in. lbs.) torque.

(2) Position the tailpipe and muffler onto the tailpipe hanger (Fig. 20).

(3) Install the muffler onto the catalytic converter. Make sure that the tailpipe has sufficient clearance from the floor pan. Install exhaust clamp and tighten the nuts to 47 N·m (35 ft. lbs.) torque (Fig. 19).

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(6) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

## TAILPIPE

## DESCRIPTION

The tailpipe is also made of stainless steel. (Fig. 18).

## OPERATION

The Tailpipe channels the exhaust out of the muffler and out from under the vehicle to control noise and prevent exhaust gas fumes from entering the passenger compartment

## FRONT ABSORBER

### REMOVAL

(1) Remove front fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(2) Remove the retainer attaching the absorber to the fascia.

(3) Separate the absorber from the fascia.

### INSTALLATION

(1) Position the absorber on the fascia.

(2) Install the retainer attaching the absorber to the fascia.

(3) Install front fascia. Refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

## FRONT FASCIA

### REMOVAL

#### REMOVAL

(1) Raise and support vehicle.

(2) Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)

(3) Turn front wheels to access rivets and remove plastic rivets attaching fascia to wheel liner.

(4) Remove bolts attaching fascia to fender (Fig. 1).

(5) Remove plastic push pin fasteners attaching front fascia to lower radiator crossmember splash shield.

(6) Disengage fog lamp connectors, if equipped.

(7) Remove screws attaching fascia to upper radiator crossmember.

(8) Slide fascia forward to separate from vehicle.

### REMOVAL - EXPORT

(1) Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/LIFT POINTS - STANDARD PROCEDURE)

(2) Turn front wheels to access rivets and remove plastic rivets attaching fascia to wheel liner.

(3) Remove bolts attaching fascia to fender (Fig. 2).

(4) Remove plastic push pin fasteners attaching front fascia to lower radiator crossmember splash shield (Fig. 3).

(5) Disengage fog lamp connectors, if equipped.

(6) Remove screws attaching fascia/grille to upper radiator crossmember (Fig. 4).

(7) Slide fascia forward to separate from vehicle.

1 - SCREW  
2 - FASCIA

**INSTALLATION****INSTALLATION**

- (1) Position the fascia onto the vehicle and engage the drive pins on the fenders.
- (2) Install the three lower push pins to the radiator crossmember.
- (3) Install the screws attaching the fascia to the fenders.
- (4) Connect the fog lamp electrical connectors, if equipped.
- (5) Install the wheelhouse splash shield rivets.
- (6) Install the four upper rivets.

**INSTALLATION - EXPORT**

- (1) Slide fascia onto vehicle engaging fascia with tabs on bottom of front fenders.
- (2) Install screws attaching fascia/grille to upper radiator crossmember (Fig. 4).
- (3) Install bolts attaching fascia to fender (Fig. 2).
- (4) Engage fog lamp connectors, if equipped.
- (5) Install plastic rivets attaching fascia to wheel liner.
- (6) Install plastic push pin fasteners attaching front fascia to lower radiator crossmember splash shield (Fig. 3).
- (7) Remove supports and lower vehicle.

**REAR ABSORBER****REMOVAL**

- (1) Remove rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
- (2) Remove rivets attaching absorber to rear crossmember (Fig. 6).
- (3) Separate absorber from vehicle.

**INSTALLATION**

- (1) Position absorber on vehicle.
- (2) Install rivets attaching absorber to rear crossmember. (Fig. 6)
- (3) Install rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

**REAR FASCIA****REMOVAL**

- (1) Raise and support vehicle.
- (2) Remove wheels.
- (3) Remove plastic push pins attaching fascia to fuel tank skid plate.
- (4) Remove plastic rivets attaching fascia to wheel liner.
- (5) Remove nuts attaching upper edge of fascia to quarter panel and wheel liner (Fig. 5).
- (6) Remove plastic push pins attaching fascia to liftgate opening (Fig. 6).
- (7) Remove screws attaching fascia to liftgate opening.
- (8) Remove D pillar trim and scuff plate outboard screws.
- (9) Remove the rearward tie down screws and the aperture trim panel.
- (10) Carefully peel back the rubber body sealer patch to access the retainer clips.
- (11) Release the forward and rearward retainer clips on both sides of the fascia.
- (12) Grasp forward edges of fascia and pull outward to disengage retainers attaching fascia to quarter panel (Fig. 7).
- (13) Separate fascia from vehicle.

## REAR FASCIA (Continued)

**INSTALLATION**

(1) Position fascia on vehicle aligning retainers with slots in quarter panel (Fig. 8).

(2) Press forward edges of fascia inward to engage retainers.

(3) Install screws attaching fascia to liftgate opening.

(4) Install plastic push pins attaching fascia to liftgate opening.

(5) Install nuts attaching upper edge of fascia to quarter panel and wheel liner.

(6) Install plastic rivets attaching fascia to wheel liner.

(7) Install support lower vehicle.

(8) Install plastic push pins attaching fascia to fuel tank skid plate.

(9) Install the interior trim panels removed to access fascia retainers.

(10) Install tie down loop screws.

(11) Install the wheels, refer to section 22 for tightening sequence and torque specifications.

## FRONT SKID PLATE

### REMOVAL

- (1) Position a support under skid plate.
- (2) Remove bolts attaching skid plate to frame (Fig. 11).
- (3) Separate skid plate from frame.

**Fig. 11 Front Skid Plate**

1 - SKID PLATE

### INSTALLATION

- (1) Position skid plate on a support.
- (2) Raise it into position
- (3) Install bolts attaching skid plate to frame. Tighten bolts to 54 N·m (40 ft. lbs.) torque.

## FRONT TOW HOOK

### REMOVAL

- (1) Remove bolts that attach tow hook bracket to the lower crossmember (Fig. 12).
- (2) Separate tow hook bracket from lower crossmember.

### INSTALLATION

- (1) Position tow hook bracket at the lower crossmember.
- (2) Install bolts attaching tow hook bracket to crossmember. Tighten bolts to 54 N·m (40 ft. lbs.) torque.

## FUEL TANK SKID PLATE

### DESCRIPTION

The fuel tank skid plate is integrated with the fuel tank. Refer to Fuel Tank for service procedures

80b46aof

**Fig. 12 Front Tow Hook**

- 2 - TOW HOOK
- 3 - BRACKET
- 4 - FUEL TANK

### INSTALLATION

- (1) position tow hook bracket on frame.
- (2) Install bolts attaching tow hook bracket to frame. Tighten bolts to 68 N·m (50 ft. lbs.) torque.
- (3) Install rear tow hook to frame brace.

## TRAILER HITCH

### REMOVAL

- (1) Remove rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
- (2) Remove screws attaching trailer harness plug to trailer hitch.
- (3) Disconnect harness connector from harness plug.
- (4) Position support stands under trailer hitch.
- (5) Remove bolts attaching trailer hitch to frame rails (Fig. 14).
- (6) Separate trailer hitch from vehicle.

**Fig. 14 Trailer Hitch**

- 1 - FUEL TANK  
2 - TRAILER HITCH

### INSTALLATION

- (1) Position trailer hitch on support stands.
- (2) Position trailer hitch on vehicle.
- (3) Install bolts attaching trailer hitch to frame rails. Tighten bolts to 68 N·m (50 lbs.) torque.
- (4) Connect harness connector to harness plug.

(5) Position harness plug in trailer hitch and install screws.

(6) Install rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

## TRANSFER CASE SKID PLATE

### REMOVAL

- (1) Support skid plate.
- (2) Remove bolts that attach skid plate to transmission support crossmember and frame sill (Fig. 15).
- (3) Remove support and skid plate from vehicle.

**Fig. 15 Transfer Case Skid Plate**

- 1 - TRANSFER CASE  
2 - NUTSERT  
3 - SKID PLATE  
4 - CROSSMEMBER

### INSTALLATION

- (1) Install nutserts, if removed.
- (2) Position and support skid plate at the frame sill and transmission support crossmember.
- (3) Attach skid plate to frame sill and crossmember with the bolts. Tighten bolts to 34 N·m (25 ft. lbs) torque.

## FUEL DELIVERY

### DESCRIPTION

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of pump module
- a separate combination fuel filter/fuel pressure regulator
  - fuel tubes/lines/hoses
  - quick-connect fittings
  - fuel injector rail
  - fuel injectors
  - fuel tank
  - fuel tank filler pipe/vent tube assembly
  - fuel tank filler tube cap
  - vapor canister assembly
  - accelerator pedal
  - throttle cable

### OPERATION

The fuel tank assembly consists of: the fuel tank, fuel tank shield, fuel tank straps, fuel pump module assembly, fuel pump module locknut/gasket, and fuel tank check valve (refer to Emission Control System for fuel tank check valve information).

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

### STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE

**Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.**

- (1) Remove fuel fill cap.
- (2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
- (3) Start and run engine until it stalls.
- (4) Attempt restarting engine until it will no longer run.
- (5) Turn ignition key to OFF position.

**CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.**

- (6) Unplug connector from any fuel injector.
- (7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.
- (8) Connect other end of jumper wire to positive side of battery.
- (9) Connect one end of a second jumper wire to remaining injector terminal.

**CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.**

- (10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.
- (11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.
- (12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.
- (13) Return fuel pump relay to PDC.
- (14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

## FUEL FILTER/PRESSURE REGULATOR

### DESCRIPTION

The combination fuel filter/pressure regulator is located in front of the fuel tank and above the rear axle (Fig. 1). It is transversely mounted to a chassis crossmember (left-to-right). **Fuel Line Identification:** The filter/regulator is equipped with 3 fuel line fittings (2 at one end and 1 at the other end). The single fitting facing the left side of the vehicle is the supply line to the fuel rail (Fig. 1). The 2 fittings facing the right side of the vehicle are connected to the fuel tank. Of these 2 fittings, the fitting towards the **front** is used for fuel return to the fuel tank. The fitting towards the **rear** is a pressure line.

### OPERATION

**Fuel Pressure Regulator Operation:** The pressure regulator is a mechanical device that is not controlled by engine vacuum or the Powertrain Control Module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa  $\pm$  34 kPa (49.2 psi  $\pm$  5 psi) at the fuel injectors. It contains

a diaphragm and calibrated springs. The internal fuel filter is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump. The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump.

If fuel pressure at the pressure regulator exceeds approximately 49 psi, an internal diaphragm closes. Excess fuel is then routed into a separate fuel return line and returned to the fuel tank through the top of the fuel pump module.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

### REMOVAL

The combination Fuel Filter/Fuel Pressure Regulator is remotely mounted to the vehicle body, above the rear axle and near the front of the fuel tank (Fig. 1) or (Fig. 2).

(1) Perform Fuel System Pressure Release Procedure.

810bc95c

## FUEL FILTER/PRESSURE REGULATOR (Continued)

- (2) Disconnect negative battery cable at battery.
- (3) Raise vehicle.
- (4) Clean area around 3 filter/regulator fittings.
- (5) Disconnect fuel supply, fuel return and fuel pressure lines at filter/regulator (Fig. 1). Refer to Quick-Connect Fittings.
- (6) Remove 2 mounting bolts (Fig. 2) and remove filter/regulator.

**Fig. 2 FUEL FILTER/FUEL PRESSURE REGULATOR REMOVAL/INSTALLATION**

- 1 - FILTER/REGULATOR  
2 - LEFT/REAR SPRING MOUNT  
3 - MOUNTING BOLTS (2)

**INSTALLATION**

- (1) Before installing filter/regulator, be sure all fittings are cleaned of all dirt and contaminants.
- (2) Be sure o-ring is positioned into fuel return fitting in filter/regulator.
- (3) Apply a small amount of clean engine oil to o-rings.
- (4) Position filter/regulator to body and install 2 bolts. Tighten bolts. Refer to Torque Specifications.
- (5) Connect 3 fittings. Refer to Quick-Connect Fittings.
- (6) Connect negative battery cable to battery.
- (7) Start engine and check for leaks.

**FUEL LEVEL SENDING UNIT / SENSOR****DESCRIPTION**

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

**OPERATION**

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

**For Fuel Gauge Operation:** A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel pump module electrical connector unplugged).** With the connectors plugged, output voltages will vary from about 0.6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models). The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

**For OBD II Emission Monitor Requirements:** The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

## FUEL LEVEL SENDING UNIT / SENSOR (Continued)

## REMOVAL

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 3). The fuel pump module is located within the fuel tank.

80ba7722

**Fig. 3 Fuel Gauge Sending Unit Location**

- 1 - FUEL PUMP MODULE
- 2 - FUEL GAUGE FLOAT
- 3 - ELECTRIC FUEL PUMP
- 4 - INLET FILTER
- 5 - FUEL GAUGE SENDING UNIT
- 6 - PIGTAIL HARNESS

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove electrical wire connector at sending unit terminals.

(4) Press upward on release tab (Fig. 4) to remove sending unit from pump module.

## INSTALLATION

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 3). The fuel pump module is located within the fuel tank.

(1) Position sending unit to pump module and snap into place.

(2) Connect electrical connector to terminals.

(3) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(4) Install fuel tank. Refer to Fuel Tank Removal/Installation.

80a58b60

- 2 - FUEL GAUGE SENDING UNIT
- 3 - RELEASE TAB
- 4 - FUEL PUMP MODULE

## FUEL LINES

## DESCRIPTION

Also refer to Quick-Connect Fittings.

**WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.**

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

**If equipped:** The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

## FUEL PUMP

### DESCRIPTION

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

### OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

**Check Valve Operation:** The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel

injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** Refer to the Fuel Pressure Leak Down Test for more information.

The electric fuel pump is not a separate, serviceable component.

## FUEL PUMP MODULE

### DESCRIPTION

The fuel pump module is installed in the top of the fuel tank (Fig. 5). The fuel pump module (Fig. 6) contains the following components:

- A separate fuel pick-up filter (strainer)
- An electric fuel pump
- A threaded locknut to retain module to tank
- A gasket between tank flange and module
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply tube (line) connection
- Fuel return tube (line) connection

The fuel gauge sending unit and pick-up filter may be serviced separately. If the electrical fuel pump

- 1 - FUEL PUMP MODULE
- 2 - FUEL GAUGE FLOAT
- 3 - ELECTRIC FUEL PUMP
- 4 - INLET FILTER
- 5 - FUEL GAUGE SENDING UNIT
- 6 - PIGTAIL HARNESS

## OPERATION

Refer to Fuel Pump, Fuel Filter/Fuel Pressure Regulator and Fuel Gauge Sending Unit.

## REMOVAL

Fuel tank removal will be necessary for fuel pump module removal.

**WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING FUEL PUMP MODULE, FUEL SYSTEM PRESSURE MUST BE RELEASED.**

- (1) Perform Fuel System Pressure Release Procedure.
- (2) Drain fuel tank and remove tank. Refer to Fuel Tank Removal/Installation.
- (3) Thoroughly wash and clean area around pump module to prevent contaminants from entering tank.
- (4) Disconnect electrical connector at top of pump module.
- (5) Disconnect fuel return and pressure lines from fuel pump module fittings (Fig. 5). Refer to Quick-Connect Fittings for procedures.
- (6) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 5). Install Special Tool

6856 to fuel pump module locknut and remove locknut (Fig. 7). While rotating tool 6856, be careful not to damage fuel fittings or electrical connector. The fuel pump module will spring up slightly after locknut is removed.

- (7) Remove module from fuel tank.

8020cd9e

- 4 - FUEL RETURN FITTING

## INSTALLATION

Fuel tank removal will be necessary for fuel pump module removal.

## FUEL PUMP MODULE (Continued)

**CAUTION:** Whenever fuel pump module is serviced, module gasket must be replaced.

(1) Thoroughly clean locknut threads and mating fuel tank threads. Use a soap/water solution. Do not use carburetor cleaner to clean threads.

(2) **Using new gasket**, position fuel pump module into opening in fuel tank.

(3) Apply clean water to locknut threads.

(4) Position locknut over top of fuel pump module.

(5) Rotate module until indexing arrow at top of module (Fig. 8) is pointed toward rear of vehicle. Align arrow to tick mark on top of fuel tank. **This step must be done to prevent float/float rod assembly from contacting sides of fuel tank.**

(6) Install Special Tool 6856 to locknut.

(7) Tighten locknut. Refer to Torque Specifications.

(8) Connect fuel return and pressure lines to fuel pump module fittings (Fig. 5). Refer to Quick-Connect Fittings.

(9) Install fuel tank. Refer to Fuel Tank Installation.

## FUEL RAIL

## DESCRIPTION

## DESCRIPTION - 4.7L

The fuel injector rail is used to mount the fuel injectors to the engine. It is mounted to the intake manifold (Fig. 9).

## DESCRIPTION - 4.0L

The fuel injector rail is used to mount the fuel injectors to the engine (Fig. 10). On the 4.0L 6-cylinder engine, a **fuel damper** is located near the center of the fuel rail (Fig. 10).

## OPERATION

## OPERATION - 4.7L

High pressure fuel from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

A fuel pressure test port is located on the fuel rail (Fig. 9). A quick-connect fitting with a safety latch is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

80b898e4

- 13 - PRESSURE TEST PORT CAP

## OPERATION - 4.0L

The fuel injector rail supplies the necessary fuel to each individual fuel injector.

High pressure fuel from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

The fuel damper is used only to help control fuel pressure pulsations. These pulsations are the result of the firing of the fuel injectors. It is **not used** as a fuel pressure regulator. The fuel pressure regulator is **not mounted** to the fuel rail on any engine. It is located near the front of the fuel tank above the rear axle. Refer to Fuel Filter/Fuel Pressure Regulator in this group for information.

- 11 - QUICK-CONNECT FITTING

A fuel pressure test port is located on the fuel rail (Fig. 10). A quick-connect fitting with a safety latch is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

## REMOVAL

## REMOVAL - 4.7L

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.**

**CAUTION:** The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube (Fig. 11). Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When

removing fuel rail assembly for any reason, be careful not to bend or kink tube.

80b898e4

**Fig. 12 Remove/Install Injector Connector—4.7L V-8 Engine**

ing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

(10) Disconnect electrical connectors at throttle body.

(11) Disconnect electrical connectors at MAP and IAT sensors.

(12) Remove first three ignition coils on each bank (cylinders #1, 3, 5, 2, 4 and 6). Refer to Ignition Coil Removal/Installation.

(13) Remove 4 fuel rail mounting bolts (Fig. 11).

(14) Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.

(15) Remove fuel rail (with injectors attached) from engine.

(16) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

## REMOVAL - 4.0L

The fuel damper is not serviced separately.

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF.**

**THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL RAIL.**

(1) Remove fuel tank filler tube cap.

(2) Perform Fuel System Pressure Release Procedure.

(3) Disconnect negative battery cable from battery.

(4) Remove air tube at top of throttle body. Note: Some engine/vehicles may require removal of air cleaner ducts at throttle body.

(5) Disconnect electrical connectors at all 6 fuel injectors. To remove connector refer to (Fig. 14). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

- 10 - MOUNTING BOLTS (4)
- 11 - QUICK-CONNECT FITTING

(6) Remove oxygen sensor wiring clip nuts at fuel rail mounting studs (certain emissions packages only).

## FUEL RAIL (Continued)

**Fig. 14 Remove/Install Injector Connector—4.0L Engine**

(7) Disconnect fuel supply line latch clip and fuel line at fuel rail. Refer to Quick-Connect Fittings.

(8) Disconnect throttle cable at throttle body. Refer to Throttle Cable Removal/Installation.

(9) Disconnect speed control cable at throttle body (if equipped). Refer to Speed Control Cable.

(10) Disconnect automatic transmission cable at throttle body (if equipped).

(11) Remove cable routing bracket at intake manifold.

(12) Clean dirt/debris from each fuel injector at intake manifold.

(13) Remove fuel rail mounting nuts/bolts (Fig. 13).

(14) Remove fuel rail by gently rocking until all fuel injectors have cleared machined holes at intake manifold.

(15) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

## INSTALLATION

### INSTALLATION - 4.7L

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.

(2) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(3) Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.

(4) Guide each injector into cylinder head. Be careful not to tear injector o-rings.

(5) Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.

(6) Install 4 fuel rail mounting bolts and tighten to 27 N·m (20 ft. lbs.).

(7) Install ignition coils. Refer to Ignition Coil Removal/Installation.

(8) Connect electrical connectors to throttle body.

(9) Connect electrical connectors to MAP and IAT sensors.

(10) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 12). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(11) Connect vacuum lines to throttle body.

(12) Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.

(13) Connect wiring to rear of generator.

(14) Install air box to throttle body.

(15) Install air duct to air box.

(16) Connect battery cable to battery.

(17) Start engine and check for leaks.

### INSTALLATION - 4.0L

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.

(2) Clean each injector bore at intake manifold.

(3) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.

(4) Position tips of all fuel injectors into the corresponding injector bore in intake manifold. Seat injectors into manifold.

(5) Install and tighten fuel rail mounting bolts to 11 ±3 N·m (100 ±25 in. lbs.) torque.

(6) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 14). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(7) Connect fuel line and fuel line latch clip to fuel rail. Refer Quick-Connect Fittings.

(8) Install protective cap to pressure test port fitting (if equipped).

(9) Install cable routing bracket to intake manifold.

(10) Connect throttle cable at throttle body.

(11) Connect speed control cable at throttle body (if equipped).

(12) Connect automatic transmission cable at throttle body (if equipped).

## FUEL RAIL (Continued)

- (13) Install oxygen sensor wiring clip nuts to fuel rail mounting studs (certain emissions packages only).
- (14) Install air tube (or duct) at top of throttle body.
- (15) Install fuel tank cap.
- (16) Connect negative battery cable to battery.
- (17) Start engine and check for fuel leaks.

## FUEL TANK

## DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module and certain ORVR components.

## OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

A fuel tank check valve(s) is mounted into the top of the fuel tank (or pump module). Refer to Fuel Tank Check Valve for additional information.

An evaporation control system is connected to the check valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using either a Leak Detection Pump (LDP), or an NVLD pump. Refer to Emission Control System for additional information.

Refer to ORVR for On-Board Refueling Vapor Recovery system information.

## REMOVAL

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF. PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL TANK.**

**Fuel level in tank below 3/4:** fuel tank draining is not necessary for tank removal.

**Fuel level in tank above 3/4:** the electric fuel pump may be activated allowing tank to be partially drained at fuel rail connection. Refer to DRB Scan Tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, remove gas cap and release fuel pressure. Refer to the Fuel System Pressure Release Procedure for procedures. Attach end of Special Adapter Hose Tool number 6539 at fuel rail

disconnection. Position opposite end of 6539 to an approved gasoline draining station. **Note: A temporary adapter fitting such as SnapOn® tool number FIA610 may be used to attach the disconnected fuel line to the approved gasoline draining station.** Activate fuel pump with DRB and drain approximately 4–5 gallons of fuel before tank removal. The fuel tank does not need to be completely emptied before removal.

**Electric fuel pump not operating, and fuel level in tank above 3/4:** the fuel tank does not need to be completely emptied before removal. Before disconnecting fuel line at fuel rail, remove gas cap and release fuel pressure. Attach an approved, suction-type gasoline draining station to disconnected fuel line at fuel rail. Drain approximately 4–5 gallons of fuel before tank removal. **Note: A temporary adapter fitting such as SnapOn® tool number FIA610 may be used to attach the disconnected fuel line to the approved gasoline draining station.**

- (1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure.
- (2) Disconnect negative battery cable at battery.
- (3) Raise and support vehicle.
- (4) Remove left rear wheel/tire.

**CAUTION: HANDLE EVAP, LDP AND ORVR VAPOR / VACUUM LINES VERY CAREFULLY. THESE LINES AND HOSES MUST BE FIRMLY CONNECTED. CHECK THE VAPOR/VACUUM LINES AT THE LDP, LDP FILTER, EVAP CANISTER, EVAP CANISTER PURGE SOLENOID AND ORVR COMPONENTS (Fig. 15) FOR DAMAGE OR LEAKS. IF A LEAK IS PRESENT, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.**

- (5) Remove stone shield behind left/rear wheel (Fig. 16). Drill out plastic rivets for removal.
- (6) Remove 3 LDP mounting bolts (Fig. 17).
- (7) Remove support bracket brace bolt (Fig. 18).
- (8) Loosen, but do not remove 2 support bracket nuts at frame rail (Fig. 17).
- (9) To separate and lower front section of two-piece support bracket, remove 3 attaching bolts on bottom of support bracket (Fig. 18). While lowering support bracket, disconnect LDP wiring clip (Fig. 19).
- (10) Remove hose clamp (Fig. 20) and remove fuel fill hose from fuel fill tube.
- (11) Cut and discard tie wrap from axle vent hose (Fig. 20).
- (12) Disconnect fuel vent hose from fuel vent tube (Fig. 20).
- (13) Disconnect ORVR hose elbow (Fig. 21) at top of EVAP canister.
- (14) Place hydraulic jack to bottom of fuel tank.

## FUEL TANK (Continued)

(15) Remove fuel tank-to-rear bumper fascia clips (Fig. 22).

(16) Remove fuel tank heat shield mounting bolts (Fig. 23).

**CAUTION:** To protect fuel tank from exhaust heat, shield must re-installed after tank installation.

**WARNING:** PLACE SHOP TOWEL AROUND FUEL LINES TO CATCH ANY EXCESS FUEL.

(17) Disconnect fuel return line at fuel filter/fuel pressure regulator (Fig. 24). Refer to Quick-Connect Fittings for procedures.

(18) Disconnect fuel pressure line at fuel filter/fuel pressure regulator (Fig. 24). Refer to Quick-Connect Fittings for procedures.

(19) Disconnect EVAP canister vent line near front of tank (Fig. 24).

(20) Disconnect fuel pump module electrical connector (pigtail harness) near front of tank (Fig. 24). Harness connector is clipped to body.

(21) Remove left / front tank support bracket bolt at frame (Fig. 25).

(22) **WITHOUT TRAILER HITCH:** Remove tank-to-frame mounting bolts (Fig. 27). Remove rear tank support bracket bolt at frame (Fig. 26). Carefully lower tank until clear of vehicle. Place tank on floor.

(23) **WITH TRAILER HITCH:** Remove tank / hitch mounting bolts (Fig. 28). Carefully lower tank until clear of vehicle. Place tank on floor.

(24) If necessary, separate skid plate from fuel tank by removing 2 fuel tank strap nuts (Fig. 27) and remove 2 tank straps.

(25) If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation.

(26) If hoses are to be removed at fuel tank end, note painted alignment (indexing) markings on hoses, and molded indexing tangs on tank before removal. Remove hoses.

(27) If necessary, remove 3 fuel filler tube assembly mounting bolts (Fig. 29) and remove fuel filler tube.

**CAUTION: HANDLE EVAP, LDP AND ORVR VAPOR / VACUUM LINES VERY CAREFULLY. THESE LINES AND HOSES MUST BE FIRMLY CONNECTED. CHECK THE VAPOR/VACUUM LINES AT THE LDP, LDP FILTER, EVAP CANISTER, EVAP CANISTER PURGE SOLENOID AND ORVR COMPONENTS FOR DAMAGE OR LEAKS. IF A LEAK IS PRESENT, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.**

- (1) If necessary, position fuel filler tube assembly to body. Install 3 bolts. Refer to Torque Specifications.
- (2) If necessary, connect quick-connect fittings to fuel pump module.
- (3) If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation.
- (4) Install fuel fill/vent hoses to tank fittings. To prevent hoses from kinking, rotate each hose until painted indexing mark on hose is aligned to molded indexing tang on tank.
- (5) Install hose clamps to hoses. Refer to Torque Specifications.
- (6) If necessary, position fuel tank into skid plate. Install 2 tank straps and 2 strap nuts (Fig. 27). Refer to Torque Specifications.
- (7) Position fuel tank / skid plate assembly to hydraulic jack.
- (8) Raise tank into position to frame.

## FUEL TANK (Continued)

(9) **WITH TRAILER HITCH:** Position trailer hitch and tow hooks (Fig. 28) to bottom of fuel tank. Install bolts and nuts loosely.

(10) **WITHOUT TRAILER HITCH:** Install 2 rear tank support brackets and bolts (Fig. 26). Install tank-to-frame bolts. Do not tighten bolts / nuts at this time.

(11) Install 1 left / front tank support bracket and bolts / nuts (Fig. 25). Do not tighten bolts / nuts at this time.

(12) Be sure fuel tank is properly aligned to frame and body. Tighten all tank, tow hook and trailer hitch bolts / nuts except for 3 support brackets. Tighten all 3 (2 rear and 1 left / front) support bracket bolts / nuts last. Refer to Torque Specifications.

(13) Connect fuel pump module pigtail harness electrical connector near front of tank.

(14) Connect both fuel lines to fuel filter/fuel pressure regulator. Refer to Quick-Connect Fittings for procedures.

(15) Connect EVAP hose near front of tank.

(16) Position rear axle vent hose and install new tie strap (Fig. 20).

(17) Install heat shield nuts / bolts (Fig. 23). Refer to Torque Specifications.

(18) Connect ORVR hose elbow (Fig. 21) to top of EVAP canister.

(19) Connect fuel vent hose to fuel vent tube (Fig. 20).

(20) Install fuel fill hose and clamp to fuel fill tube (Fig. 20).

(21) Install 3 LDP mounting bolts (Fig. 17).

(22) While raising support bracket, connect LDP wiring clip (Fig. 19). Install front section of two-piece support bracket to rear section with 3 attaching bolts located on bottom of support bracket (Fig. 18).

(23) Install support bracket brace bolt (Fig. 18).

(24) Tighten 2 support bracket nuts at frame rail (Fig. 17).

(25) Install fuel tank-to-rear bumper fascia clips (Fig. 22).

(26) Using new plastic rivets, install stone shield behind left/rear wheel (Fig. 16).

(27) Install left rear wheel/tire.

(28) Lower vehicle and connect negative battery cable to battery.

(29) Fill tank with fuel and check for leaks.

## INLET FILTER

## REMOVAL

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 30). The fuel pump module is located on top of fuel tank.

80ba7725

**Fig. 30 Fuel Pump Inlet Filter**

- 1 - FUEL PUMP MODULE  
2 - FUEL PUMP INLET FILTER

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 30). The fuel pump module is located on top of fuel tank.

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove filter by prying from bottom of module with 2 screwdrivers. Filter is snapped to module.

(4) Clean bottom of pump module.

## INSTALLATION

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 30). The fuel pump module is located on top of fuel tank.

(1) Snap new filter to bottom of module.

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/Installation.

## QUICK CONNECT FITTING

### DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

**CAUTION:** The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

### STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

### DISCONNECTING

**WARNING:** THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

**CAUTION:** The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) **2-Button Type Fitting:** This type of fitting is equipped with a push-button located on each side of quick-connect fitting (Fig. 31). Press on both buttons

simultaneously for removal. Special tools are not required for disconnection.

80cc704d

**Fig. 31 2-BUTTON TYPE FITTING**

- 1 - QUICK-CONNECT FITTING  
2 - PUSH-BUTTONS (2)

(5) **Pinch-Type Fitting:** This fitting is equipped with two finger tabs. Pinch both tabs together while removing fitting (Fig. 32). Special tools are not required for disconnection.

80d85327

2 - PINCH TABS

## QUICK CONNECT FITTING (Continued)

(6) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 33). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Special tools are not required for disconnection.

(a) Press release tab on side of fitting to release pull tab (Fig. 34). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 34).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 35).

80a35405

**Fig. 36 TYPICAL 2-TAB TYPE FITTING**

- 1 - TAB(S)
- 2 - QUICK-CONNECT FITTING

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 36) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

J9514-6

**Fig. 40 FUEL LINE DISCONNECTION USING SPECIAL TOOL**

- 1 - SPECIAL FUEL LINE TOOL
- 2 - FUEL LINE
- 3 - FUEL RAIL

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 37). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

## QUICK CONNECT FITTING (Continued)

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(9) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 38) or (Fig. 39). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 38).

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 39) and swing away from fuel line.

(c) Slide latch clip toward fuel rail while lifting with screwdriver.

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 40). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(10) Disconnect quick-connect fitting from fuel system component being serviced.

## CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

## ACCELERATOR PEDAL

### REMOVAL

The accelerator pedal is connected to the throttle body linkage by the throttle cable. The cable is protected by a plastic sheathing and is connected to the throttle body linkage by a ball socket. It is connected to the accelerator pedal arm by a plastic retainer (clip) (Fig. 1). This retainer (clip) snaps into the top of the accelerator pedal arm. A retainer clip (Fig. 1) is also used to fasten cable to dash panel.

80b77008

- 1 - CLIP
- 2 - ACCELERATOR CABLE
- 3 - CABLE CONNECTOR
- 4 - MOUNTING NUTS (2)
- 5 - PEDAL/BRAKET ASSEMBLY
- 6 - MOUNTING STUDS (2)

**CAUTION:** Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm. Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove accelerator pedal bracket nuts. Remove accelerator pedal assembly.

### INSTALLATION

The accelerator pedal is connected to the throttle body linkage by the throttle cable. The cable is protected by a plastic sheathing and is connected to the throttle body linkage by a ball socket. It is connected to the accelerator pedal arm by a plastic retainer (clip) (Fig. 1). This retainer (clip) snaps into the top of the accelerator pedal arm. A retainer clip (Fig. 1) is also used to fasten cable to dash panel.

(1) Place accelerator pedal assembly over studs protruding from floor pan. Tighten mounting nuts to  $12 \text{ N}\cdot\text{m} \pm 2 \text{ N}\cdot\text{m}$  (105 in. lbs.  $\pm$  20 in. lbs.) torque.

(2) Slide throttle cable into opening in top of pedal arm. Push plastic cable retainer (clip) into pedal arm opening until it snaps into place.

(3) Before starting engine, operate accelerator pedal to check for any binding.

## CRANKSHAFT POSITION SENSOR

### DESCRIPTION

#### DESCRIPTION - 4.0L

The Crankshaft Position Sensor (CKP) is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 2).

80b89904

**Fig. 2 CKP Sensor Location—4.0L 6-Cyl. Engine**

## CRANKSHAFT POSITION SENSOR (Continued)

## DESCRIPTION - 4.7L

The Crankshaft Position Sensor (CKP) is mounted into the engine block above the starter motor (Fig. 3).

**Fig. 3 CKP Sensor Location—4.7L V-8 Engine**

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - STARTER
- 3 - ELEC. CONNECTOR

## OPERATION

## OPERATION - 4.0L

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On 4.0L 6-cylinder engines, the flywheel/drive plate has 3 sets of four notches at its outer edge (Fig. 4).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM. For each engine revolution there are 3 sets of four pulses generated.

The trailing edge of the fourth notch, which causes the pulse, is four degrees before top dead center (TDC) of the corresponding piston.

The engine will not operate if the PCM does not receive a crankshaft position sensor input.

**Fig. 4 CKP Sensor Operation—4.0L 6-Cyl. Engine**

## OPERATION - 4.7L

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On the 4.7L V-8 engine, a tonewheel is bolted to the engine crankshaft (Fig. 5). This tonewheel has sets of notches at its outer edge (Fig. 5).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.

## REMOVAL

## REMOVAL - 4.0L

The Crankshaft Position (CKP) sensor is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 6). The sensor is **adjustable** and is attached with one bolt. A wire shield/router is attached to the sensor (Fig. 6).

(1) Disconnect sensor pigtail harness (3-way connector) from main engine wiring harness.

## CRANKSHAFT POSITION SENSOR (Continued)

**Fig. 5 CKP Sensor Operation and Tonewheel—4.7L V-8 Engine**

- 3 - WIRE SHIELD
- 4 - MOUNTING BOLT
- 5 - TRANSMISSION HOUSING
- 6 - PAPER SPACER

- (2) Remove sensor mounting bolt.
- (3) Remove wire shield and sensor.

## REMOVAL - 4.7L

The Crankshaft Position (CKP) sensor is bolted to the side of the engine cylinder block above the starter motor (Fig. 7). It is positioned into a machined hole at the side of the engine block.

**Fig. 7 CKP Sensor Location—4.7L V-8 Engine**

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - STARTER
- 3 - ELEC. CONNECTOR

- (1) Remove starter motor. Refer to Starter Removal/Installation.
- (2) Disconnect CKP electrical connector at sensor (Fig. 7).
- (3) Remove CKP mounting bolt (Fig. 8).
- (4) Carefully twist sensor from cylinder block.
- (5) Remove sensor from vehicle.
- (6) Check condition of sensor o-ring.

## INSTALLATION

## INSTALLATION - 4.0L

The Crankshaft Position (CKP) sensor is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 6). The sensor is **adjustable** and is attached with one bolt. A wire shield/router is attached to the sensor (Fig. 6).

New replacement sensors will be equipped with a paper spacer glued to bottom of sensor. If installing (returning) a **used** sensor to vehicle, a new paper spacer must be installed to bottom of sensor. This spacer will be ground off the first time engine is started. If spacer is not used, sensor will be broken the first time engine is started.

## CRANKSHAFT POSITION SENSOR (Continued)

**Fig. 8 CKP Sensor Removal/Installation—4.7L V-8 Engine**

- 1 - CRANKSHAFT POSITION SENSOR  
2 - MOUNTING BOLT

(1) New Sensors: Be sure paper spacer is installed to bottom of sensor. If not, obtain spacer PN05252229.

(2) Used Sensors: Clean bottom of sensor and install spacer PN05252229.

(3) Install sensor into transmission bellhousing hole.

(4) Position sensor wire shield to sensor (Fig. 6).

(5) Push sensor against flywheel/drive plate. With sensor pushed against flywheel/drive plate, tighten mounting bolt to 7 N·m (60 in. lbs.) torque.

(6) Route sensor wiring harness into wire shield.

(7) Connect sensor pigtail harness electrical connector to main wiring harness.

### INSTALLATION - 4.7L

(1) Clean out machined hole in engine block.

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into engine block with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

**CAUTION:** Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten to 28 N·m (21 ft. lbs.) torque.

(5) Connect electrical connector to sensor.

(6) Install starter motor. Refer to Starter Removal/Installation.

## FUEL INJECTOR

### DESCRIPTION

A separate fuel injector (Fig. 9) is used for each individual cylinder.

**Fig. 9 Fuel Injector—4.0L/4.7L Engines**

- 1 - FUEL INJECTOR  
2 - NOZZLE  
3 - TOP (FUEL ENTRY)

### OPERATION

#### OPERATION

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The top (fuel entry) end of the injector (Fig. 9) is attached into an opening on the fuel rail.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are electrically energized, individually and in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The

## FUEL INJECTOR (Continued)

PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

## OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

## REMOVAL

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL INJECTOR(S), FUEL SYSTEM PRESSURE MUST BE RELEASED.**

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

(1) Perform Fuel System Pressure Release Procedure.

(2) Remove fuel injector rail. Refer to Fuel Injector Rail Removal/Installation.

(3) Remove clip(s) retaining injector(s) to fuel rail (Fig. 10).

(4) Remove injector(s) from fuel rail.

## INSTALLATION

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

(3) Install fuel rail assembly. Refer to Fuel Injector Rail Removal/Installation.

(4) Start engine and check for leaks.

80b898e8

**Fig. 10 Fuel Injector Mounting—Typical (4.7L V-8 Engine Shown)**

## FUEL PUMP RELAY

### DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

### OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

## IDLE AIR CONTROL MOTOR

### DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

## IDLE AIR CONTROL MOTOR (Continued)

## OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

**IAC Stepper Motor Program:** The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory

cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a "No-Load" engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

## REMOVAL

## REMOVAL - 4.0L

The IAC motor is located on the throttle body.

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect electrical connector from IAC motor (Fig. 25).
- (3) Remove two mounting bolts (screws) (Fig. 11).
- (4) Remove IAC motor from throttle body.

**Fig. 11 Mounting Bolts (Screws)—IAC**

- 1 - IDLE AIR CONTROL MOTOR  
2 - MOUNTING SCREWS

## IDLE AIR CONTROL MOTOR (Continued)

**REMOVAL - 4.7L**

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect electrical connector from IAC motor (Fig. 21).
- (3) Remove two mounting bolts (screws) (Fig. 27).
- (4) Remove IAC motor from throttle body.

**INSTALLATION****INSTALLATION - 4.0L**

The IAC motor is located on the throttle body.

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner duct/air box to throttle body.

**INSTALLATION - 4.7L**

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air duct/air box to throttle body.

**INTAKE AIR TEMPERATURE SENSOR****DESCRIPTION**

The 2-wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

**OPERATION**

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5-volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

## INTAKE AIR TEMPERATURE SENSOR (Continued)

### INSTALLATION

#### INSTALLATION - 4.0L

The Intake Manifold Air Temperature (IAT) sensor is installed into the intake manifold plenum near the front of the throttle body (Fig. 12).

- (1) Install sensor into intake manifold. Tighten sensor to 28 N·m (20 ft. lbs.) torque.
- (2) Connect electrical connector to sensor.

#### INSTALLATION - 4.7L

##### Threaded Type Sensor

- (1) Install sensor (Fig. 13) into intake manifold. Tighten sensor to 28 N·m (20 ft. lbs.) torque.
- (2) Connect electrical connector to sensor.

##### Snap-In Type Sensor

- (1) Check condition of sensor o-ring (Fig. 15).
- (2) Clean sensor mounting hole in intake manifold.
- (3) Position sensor (Fig. 14) into intake manifold and rotate clockwise until past release tab.
- (4) Install electrical connector.

## MAP SENSOR

### DESCRIPTION

#### DESCRIPTION

On the 4.0L six-cylinder engine the MAP sensor is mounted to the engine throttle body. On the 4.7L V-8 engine the MAP sensor is mounted to front of the intake manifold.

#### DESCRIPTION - 4.7L

The MAP sensor is located on the front of the intake manifold. An o-ring seals the sensor to the intake manifold.

### OPERATION

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor,

it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

## MAP SENSOR (Continued)

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops .10 in. Hg. If a storm goes through it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

## REMOVAL

## REMOVAL - 4.0L

The MAP sensor is mounted to the side of the throttle body (Fig. 16). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 16).

8105d0ba

- (4) Remove MAP sensor from intake manifold.

## MAP SENSOR (Continued)

## INSTALLATION

## INSTALLATION - 4.0L

The MAP sensor is mounted to the side of the throttle body. An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 16).

- (1) Install rubber L-shaped fitting to MAP sensor.
- (2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.
- (3) Install MAP sensor mounting bolt (screw). Tighten screw to 3 N·m (25 in. lbs.) torque.
- (4) Install air cleaner duct/air box.

## INSTALLATION - 4.7L

The MAP sensor is located on the front of the intake manifold (Fig. 17). An o-ring seals the sensor to the intake manifold.

- (1) Clean MAP sensor mounting hole at intake manifold.
- (2) Check MAP sensor o-ring seal for cuts or tears.
- (3) Position sensor into manifold.
- (4) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (5) Connect electrical connector.

## O2S HEATER RELAY

## DESCRIPTION

The 2 oxygen (O<sub>2</sub>) sensor heater relays (upstream and downstream) are located in the Powertrain Distribution Center (PDC).

## OPERATION

Engines equipped with the California (NAE) Emissions Package use **four O<sub>2</sub> sensors**.

Two of the four sensor heater elements (upstream sensors 1/1 and 2/1) are controlled by the upstream heater relay through output signals from the Powertrain Control Module (PCM).

The other two heater elements (downstream sensors 1/2 and 2/2) are controlled by the downstream heater relay through output signals from the PCM.

To avoid a large simultaneous current surge, power is delayed to the 2 downstream heater elements by the PCM for approximately 2 seconds.

## REMOVAL

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

## INSTALLATION

- (1) Install relay to PDC.
- (2) Install cover to PDC.

## O2S SENSOR

## DESCRIPTION

The Oxygen Sensors (O<sub>2</sub>S) are attached to, and protrude into the vehicle exhaust system. Depending on the emission package, the vehicle may use a total of either 2 or 4 sensors.

**Federal Emissions Package:** Two sensors are used: upstream (referred to as 1/1) and downstream (referred to as 1/2). With this emission package, the upstream sensor (1/1) is located just before the main catalytic converter. The downstream sensor (1/2) is located just after the main catalytic converter.

**4.7L V-8 With California Emissions Package:** On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the right upstream sensor (2/1) is located in the right exhaust downpipe just before the mini-catalytic converter. The left upstream sensor (1/1) is located in the left exhaust downpipe just before the mini-catalytic converter. The right downstream sensor (2/2) is located in the right exhaust downpipe just after the mini-catalytic converter, and before the main catalytic converter. The left downstream sensor (1/2) is located in the left exhaust downpipe just after the mini-catalytic converter, and before the main catalytic converter.

**4.0L 6-Cylinder With California Emissions Package:** On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the rear/upper upstream sensor (2/1) is located in the exhaust downpipe just before the rear mini-catalytic converter. The front/upper upstream sensor (1/1) is located in the exhaust downpipe just before the front mini-catalytic converter. The rear/lower downstream sensor (2/2) is located in the exhaust downpipe just after the rear mini-catalytic converter, and before the main catalytic converter. The front/lower downstream sensor (1/2) is located in the exhaust downpipe just after the front mini-catalytic converter, and before the main catalytic converter.

## OPERATION

An O<sub>2</sub> sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the

## O2S SENSOR (Continued)

output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the O2 sensor case housing.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

**Oxygen Sensor Heaters/Heater Relays:** Depending on the emissions package, the heating elements within the sensors will be supplied voltage from either the ASD relay, or 2 separate oxygen sensor relays. Refer to Wiring Diagrams to determine which relays are used.

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 4.5 ohms on 4.0L engines. It is approximately 13.5 ohms on the 4.7L engine. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

**Upstream Sensor (Non-California Emissions):** The upstream sensor (1/1) provides an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensor. The PCM will change the air/fuel ratio until the upstream sensor inputs a voltage that the PCM has determined will make the downstream sensor output (oxygen content) correct.

The upstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

**Downstream Sensor (Non-California Emissions):** The downstream oxygen sensor (1/2) is also used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

**Upstream Sensors (California Engines):** Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

**Downstream Sensors (California Engines):** Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

## REMOVAL

**Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.**

## O2S SENSOR (Continued)

Oxygen sensor (O2S) locations are shown in (Fig. 18) and (Fig. 19).

**WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER(S) BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.**

- (1) Raise and support vehicle.
- (2) Disconnect O2S pigtail harness from main wiring harness.
- (3) If equipped, disconnect sensor wire harness mounting clips from engine or body.

**CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.**

- (4) Remove O2S sensor with an oxygen sensor removal and installation tool.

## INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

- (1) Install O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
- (2) Connect O2S sensor wire connector to main wiring harness.
- (3) If equipped, connect sensor wire harness mounting clips to engine or body. **When Equipped: The O2S pigtail harness must be clipped and/or bolted back to their original positions on engine or body to prevent mechanical damage to wiring..**
- (4) Lower vehicle.

## THROTTLE BODY

### DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

### OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

### REMOVAL

#### REMOVAL - 4.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

(1) Remove air cleaner duct and air resonator box at throttle body.

(2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 20).

(3) Remove all control cables from throttle body (lever) arm. Refer to Accelerator Pedal and Throttle Cable.

(4) Remove four throttle body mounting bolts.

(5) Remove throttle body from intake manifold.

(6) Discard old throttle body-to-intake manifold gasket.

80b898f7

- 4 - IAC MOTOR CONNECTOR
- 5 - TPS CONNECTOR

- (3) Remove vacuum line at throttle body.
- (4) Remove all control cables from throttle body (lever) arm. Refer to Accelerator Pedal and Throttle Cable.
- (5) Remove three throttle body mounting bolts (Fig. 21).
- (6) Remove throttle body from intake manifold.

## INSTALLATION

## INSTALLATION - 4.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

(1) Clean the mating surfaces of the throttle body and the intake manifold.

(2) Install new throttle body-to-intake manifold gasket.

(3) Install throttle body to intake manifold.

(4) Install four mounting bolts. Tighten bolts to 11 N·m (100 in. lbs.) torque.

(5) Install control cables.

(6) Install electrical connectors.

(7) Install air duct and air box at throttle body.

## INSTALLATION - 4.7L

(1) Clean throttle body-to-intake manifold o-ring.

(2) Clean mating surfaces of throttle body and intake manifold.

(3) Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.

(4) Install three mounting bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.

(5) Install control cables.

(6) Install vacuum line to throttle body.

(7) Install electrical connectors.

(8) Install air duct/air box at throttle body.

## THROTTLE CONTROL CABLE

### REMOVAL

#### REMOVAL - 4.0L

**CAUTION:** Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 1). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove cable core wire at pedal arm.

(3) From inside vehicle, remove clip holding cable to dashpanel (Fig. 1).

(4) Remove cable housing from dash panel and pull into engine compartment.

(5) Remove (unsnap) cable from routing clips on engine valve cover.

**Fig. 22 Throttle (Accelerator) Cable at Throttle Body—4.0L Engine**

- 1 - ACCELERATOR CABLE
- 2 - OFF
- 3 - OFF
- 4 - THROTTLE BODY BELLCRANK
- 5 - SPEED CONTROL CABLE
- 6 - RELEASE TABS
- 7 - BRACKET

(6) Remove cable connector at throttle body bellcrank ball by unsnapping rearward (Fig. 22).

(7) Remove throttle cable from bracket by compressing release tabs (Fig. 22) and pushing cable through hole in bracket.

(8) Remove throttle cable from vehicle.

#### REMOVAL - 4.7L

**CAUTION:** Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 1). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove cable core wire at pedal arm.

(3) From inside vehicle, remove clip holding cable to dashpanel (Fig. 1).

(4) Remove air box at throttle body.

(5) Unsnap cable from plenum routing clip.

(6) Remove cable housing from dash panel and pull into engine compartment.

(7) Using finger pressure only, disconnect accelerator cable connector at throttle body bellcrank pin by pushing connector off bellcrank pin towards front of vehicle (Fig. 23). **DO NOT try to pull connector off perpendicular to the bellcrank pin. Connector will be broken.**

(8) Lift accelerator cable from top of cable cam (Fig. 23).

(9) Press tab (Fig. 24) to release plastic cable mount from bracket. **Press on tab only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (Fig. 24) towards passenger side of vehicle to remove cable from bracket.

(10) Remove throttle cable from vehicle.

## THROTTLE CONTROL CABLE (Continued)

## INSTALLATION

## INSTALLATION - 4.0L

- (1) Slide throttle cable through hole in bracket until release tabs lock into bracket.
- (2) Connect cable ball end to throttle body bellcrank ball (snaps on).
- (3) Snap cable into routing clips on engine valve cover.
- (4) Slide rubber grommet away from plastic cable housing.
- (5) Install rubber grommet into dash panel until seated.
- (6) Push cable housing into rubber grommet and through opening in dash panel.
- (7) From inside vehicle, install clip holding cable to dashpanel (Fig. 1).
- (8) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.
- (9) Push cable retainer (clip) into pedal arm opening until it snaps in place.
- (10) Before starting engine, operate accelerator pedal to check for any binding.

**Fig. 24 Accelerator Cable Release Tab—4.7L V-8 Engine**

- 1 - ACCELERATOR CABLE
- 2 - PLASTIC CABLE MOUNT
- 3 - PRESS TAB FOR REMOVAL
- 4 - CABLE BRACKET
- 5 - SLIDE FOR REMOVAL

## INSTALLATION - 4.7L

- (1) Slide accelerator cable plastic mount into bracket. Continue sliding until tab (Fig. 24) is aligned to hole in mounting bracket.
- (2) Route accelerator cable over top of cable cam.
- (3) Connect cable end to throttle body bellcrank pin (snaps on rearward).
- (4) Slide rubber grommet away from plastic cable housing.
- (5) Install rubber grommet into dash panel until seated.
- (6) Push cable housing into rubber grommet and through opening in dash panel.
- (7) From inside vehicle, install clip holding cable to dashpanel (Fig. 1).
- (8) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.
- (9) Push cable retainer (clip) into pedal arm opening until it snaps in place.
- (10) Snap cable into plenum routing clip.
- (11) Install air box to throttle body.
- (12) Before starting engine, operate accelerator pedal to check for any binding.

## THROTTLE POSITION SENSOR

### DESCRIPTION

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade.

### OPERATION

The TPS is a 3-wire variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance (output voltage) of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
  - Deceleration fuel lean out
  - Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
  - A/C WOT cutoff (certain automatic transmissions only)

### REMOVAL

#### REMOVAL - 4.0L

The TPS is mounted to the throttle body.

- (1) Disconnect TPS electrical connector (Fig. 25).
- (2) Remove TPS mounting screws (Fig. 26).
- (3) Remove TPS.

80b898f7

## THROTTLE POSITION SENSOR (Continued)

## REMOVAL - 4.7L

The TPS is located on the throttle body.

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect TPS electrical connector (Fig. 21).
- (3) Remove two TPS mounting bolts (screws) (Fig. 27).

**Fig. 27 TPS Mounting Bolts—4.7L V-8**

- 1 - THROTTLE BODY
- 2 - TPS
- 3 - IAC MOTOR
- 4 - IAT SENSOR (THREADED TYPE)
- 5 - MOUNTING SCREWS

- (4) Remove TPS from throttle body.

## INSTALLATION

## INSTALLATION - 4.0L

The TPS is mounted to the throttle body.

The throttle shaft end of throttle body slides into a socket in the TPS (Fig. 28). The TPS must be installed so that it can be rotated a few degrees. (If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs). The TPS will be under slight tension when rotated.

**Fig. 28 Throttle Position Sensor Installation—4.0L Engine**

- 1 - TANGS
- 2 - THROTTLE SHAFT
- 3 - THROTTLE BODY
- 4 - TPS

- (1) Install TPS and retaining screws.
- (2) Tighten screws to 7 N·m (60 in. lbs.) torque.
- (3) Connect TPS electrical connector to TPS.
- (4) Manually operate throttle (by hand) to check for any TPS binding before starting engine.

## THROTTLE POSITION SENSOR (Continued)

**INSTALLATION - 4.7L**

The throttle shaft end of throttle body slides into a socket in TPS (Fig. 29). The TPS must be installed so that it can be rotated a few degrees. If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs. The TPS will be under slight tension when rotated.

- (1) Install TPS and two retaining bolts.
- (2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
- (3) Manually operate throttle control lever by hand to check for any binding of TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air duct/air box to throttle body.

STEERING

DESCRIPTION - POWER STEERING SYSTEM

The power steering pump (Fig. 1) is a constant flow rate and displacement vane type pump. The pump reservoir is attached to the pump body. The pump is connected to the steering by the pressure and return hoses. The steering gear (Fig. 1) used is a recirculating ball type gear. A tilt and non-tilt column provide steering input.

The power steering system consists of:

80c07226

Fig. 1 POWER STEERING GEAR & PUMP 4.0L

- 1 - STEERING GEAR
- 2 - PRESSURE HOSE
- 3 - PUMP
- 4 - RETURN HOSE
- 5 - RESERVOIR

OPERATION - POWER STEERING SYSTEM

The rack piston balls act as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which moves the steering linkage.

## STEERING (Continued)

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - POWER STEERING SYSTEM

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

## STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	<ol style="list-style-type: none"> <li>1. Steering intermediate shaft to dash panel seal.</li> <li>2. ## DIAGNOSIS AND TESTING - STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 (Fig. 2) and Adapter Kit 6893.

## FLOW AND PRESSURE TEST

- (1) Check the power steering belt to ensure it is in good condition and adjusted properly.
- (2) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6865.
- (3) Connect Adapter 6826 to Power Steering Analyzer test valve end.
- (4) Disconnect the high pressure hose from the power steering pump.
- (5) Connect Tube 6865 to the pump hose fitting.

80ac82e2

Fig. 2 Power Steering Analyzer

- 1 - TUBE
- 2 - ADAPTER FITTINGS
- 3 - ANALYZER
- 4 - GAUGE HOSE

- (6) Connect the power steering hose from the steering gear to Adapter 6826.
- (7) Open the test valve completely.

## STEERING (Continued)

(8) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge.

(9) Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.

(10) The initial pressure reading should be 345-552 kPa (50-80 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.

(11) Increase the engine speed to 1500 RPM and read the flow meter. The reading should be 2.4 - 2.8 GPM, if the reading is below this specification the pump should be replaced.

**CAUTION:** This next step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(12) Close valve fully three times for three seconds and record highest pressure indicated each time. **All three readings must be at pump relief pressure specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

**CAUTION:** Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

(13) Open the test valve and turn the steering wheel to the extreme left and right positions against the stops. Record the highest pressure reading at each position. Compare readings to the pump specifications chart. If pressures readings are not within 50 psi. of each other, the gear is leaking internally and must be repaired.

## GEAR INLET SPECIFICATIONS 4.0L &amp; 4.7L

ENGINE	RELIEF PRESSURE $\pm$ 50	FLOW RATE (GPM)
4.0L	9653 kPa (1400 psi)	1500 RPM 2.4 - 2.8 GPM
4.7L	9653 kPa (1450 psi)	

## PUMP MOTOR SPECIFICATIONS 4.7L

ENGINE	RELIEF PRESSURE $\pm$ 50	FLOW RATE (GPM)
4.7L	9653 kPa (1900 psi)	1100 RPM 2.4-2.8 GPM Minimum @ 200 psi

## DIAGNOSIS AND TESTING - 4.7L - HYDRAULIC

The following procedures are used to test the operation of the power steering and hydraulic fan systems on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with any maximum relief pressure. Perform test anytime a power steering system problem is present. This test will determine if the power steering pump, hydraulic fan, and power steering gear are not functioning properly. It will also determine if the flow coming out of the hydraulic fan motor is sufficient for the power steering gear. The following pressure and flow test is performed using the Power Steering Analyzer Tool kit 6815 (Fig. 2) and Adapter kit 8630 (Fig. 3).

**Fig. 3 4.7L HYDRAULIC POWER STEERING TEST ADAPTERS**

## FLOW TEST - FLOW FROM POWER STEERING PUMP

- (1) Check the power steering belt to ensure it is in good condition and adjusted properly.
- (2) Connect the pressure gauge hose from the Power Steering Analyzer to Tube 8630-2.
- (3) Connect Adapter 8630-3 to Power Steering Analyzer test valve end.
- (4) Disconnect the high pressure hose from the power steering pump.
- (5) Connect Tube 8630-2 to the pump hose fitting.
- (6) Connect the power steering hose from the fan motor to Adapter 8630-3.
- (7) Open the test valve completely.

## STEERING (Continued)

(8) Start engine and let idle long enough to circulate power steering fluid through the flow/pressure test gauge.

(9) Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.

(10) The initial pressure reading should be 483 - 690 kPa (70 - 100 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.

(11) Increase the engine speed to 1100 rpm and read the flow meter. The reading should be 2.6 GPM minimum, if the reading is below this specification, the pump should be replaced.

### FLOW AND PRESSURE TEST - FLOW FROM HYDRAULIC FAN MOTOR TO STEERING GEAR (should be done if necessary after the Pump flow test)

(1) Connect the pressure gauge hose from the Power Steering Analyzer to Fitting 8630-1.

(2) Connect Adapter 8630-4 to Power Steering Analyzer test valve end.

(3) Disconnect the high pressure hose from the power steering gear.

(4) Connect Fitting 8630-1 to the high pressure hose.

(5) Connect Adapter 8630-4 to the power steering gear.

(6) Open the test valve completely.

(7) Start engine and let idle long enough to circulate power steering fluid through the flow/pressure test gauge.

(8) Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.

(9) The initial pressure reading should be 345-552 kPa (50-80 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.

(10) Increase the engine speed to 1500 RPM and read the flow meter. The reading should be 2.4 - 2.8 GPM if the reading is below this specification the fan should be replaced.

**CAUTION: This next step involves testing maximum fan motor steering relief pressure. Do not leave the valve closed for more than three seconds.**

(11) Close the valve fully three times for three seconds and record highest pressures indicated each time. All three readings must be at fan motor steering relief pressures.

(12) Open the test valve and turn the steering wheel to the extreme left and right positions against the stops. Record the highest pressure readings at each position. If pressure readings are not within 50 psi from each other, the gear is leaking internally and must be repaired.

DESCRIPTION

SERVICE WARNINGS AND CAUTIONS

DESCRIPTION

**NOTE:** The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

The tilt column (Fig. 1) has been designed to be serviced as an assembly, less the wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

To service the steering wheel, switches or airbag,(Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING).

**WARNING:** THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO

80b6f0a2

Fig. 1 Steering Column

MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

## COLUMN (Continued)

**CAUTION:** Safety goggles should be worn at all times when working on steering columns.

**NOTE:** Ensure the puller jaws are seated in the pockets (Fig. 3) of the steering wheel armature.

## REMOVAL

**WARNING:** BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

- (1) Position front wheels straight ahead.
- (2) Disconnect and isolate the negative (ground) cable from the battery.
- (3) Remove the airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
- (4) Remove the steering wheel nut and remove wheel with Puller C-3894-A (Fig. 2).

**Fig. 2 Steering Wheel Puller**

## COLUMN (Continued)

(13) Remove the column coupler bolt (Fig. 13) and slide the coupler off the column shaft.

**Fig. 13 Column Coupler Bolt And Mounting Nuts**

- 1 - COLUMN MOUNTING NUTS  
2 - COUPLER BOLT

(14) Remove the column mounting nuts (Fig. 13) and lower column off mounting studs. Remove the column from the vehicle.

(15) Remove the ignition switch, cylinder and SKIM, (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL). (Fig. 14).

**Fig. 14 Ignition Switch And SKIM**

- 1 - SKIM  
2 - IGNITION SWITCH

## INSTALLATION

**WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. (Refer to 8 - ELEC-**

**TRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).**

(1) Install the ignition switch, cylinder and SKIM, (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - INSTALLATION).

(2) Install the column into the vehicle and lift the column up onto the mounting studs. Install the mounting nuts and tighten to 12 N·m (105 in. lbs.).

(3) Slide the coupler onto the column shaft and install the coupler bolt. Tighten the coupler bolt to 49 N·m (36 ft. lbs.).

(4) Turn the ignition key to the on position then release and install the shifter interlock cable (Fig. 12) into ignition lock cylinder housing.

(5) Verify ignition switch and shifter interlock operation, (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - 42RE/GEAR SHIFT CABLE - ADJUSTMENTS).

(6) Slide the multifunction switch and clock spring onto the column as an assembly (Fig. 11).

(7) Install the multifunction switch mounting screw (Fig. 10).

(8) Connect the multifunction switch (Fig. 9) and ignition switch harness.

(9) Install the upper fixed shroud and mounting screws (Fig. 8).

(10) Install the lower steering column shroud to the steering column. Install and tighten the mounting screw.

(11) Install the upper column shroud. Align the upper shroud to the lower shroud and snap the two shroud halves together.

(12) Install the knee blocker cover (Fig. 5), (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(13) Install the cluster bezel by inserting it into the instrument panel (Fig. 4).

(14) Align the steering wheel with the column index spline and install the wheel on the column shaft. Pull the clockspring wire harness through the steering wheel armature spokes.

(15) Install and tighten the steering wheel mounting nut to 61 N·m (45 ft. lbs.).

(16) Connect the steering wheel wire harness connector to the clock spring connector.

(17) Install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(18) Connect the negative (ground) cable to the battery.

## IGNITION SWITCH

## DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key lock cylinder is used to engage/disengage the electrical ignition switch.

## DIAGNOSIS AND TESTING - IGNITION SWITCH

## ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in Wiring Diagrams.

## MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

**Vehicles equipped with an automatic transmission and a floor mounted shifter:** a cable is

used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is rotated to any position. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

If the ignition key is difficult to rotate to or from any position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment, (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - 44RE/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS).

**Vehicles equipped with an automatic transmission and a steering column mounted shifter:** an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the any position. If it is difficult to rotate the key to or from any position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

## IGNITION SWITCH (Continued)

## REMOVAL

## IGNITION SWITCH REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Remove key cylinder. Refer to previous steps.
- (2) Remove lower steering column cover screws and remove cover (Fig. 19).

**Fig. 15 Ignition Switch Lock Tab**

- 1 - LOCK TAB
- 2 - IGNITION SWITCH
- 3 - SCREWDRIVER

**Fig. 17 Ignition Switch Removal/Installation**

- 1 - TAMPER PROOF SCREW
- 2 - IGNITION SWITCH
- 3 - ELECTRICAL CONNECTORS

- (3) Remove ignition switch mounting screw (Fig. 17). Use tamper proof torx bit to remove the screw.
- (4) Using a small screwdriver, push on locking tab (Fig. 15) and remove switch from steering column.
- (5) Disconnect two electrical connectors at rear of ignition switch (Fig. 17).

## INSTALLATION

## IGNITION SWITCH INSTALLATION

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Before installing ignition switch, rotate the slot in the switch to the ON position (Fig. 16).
- (2) Connect two electrical connectors to rear of ignition switch. Make sure that locking tabs are fully seated into wiring connectors.
- (3) Position switch to column and install tamper proof screw. Tighten screw to 3 N-m (26 in. lbs.).
- (4) Install steering column lower cover.

## KEY-IN IGNITION SWITCH

## DESCRIPTION

The key-in ignition switch is concealed within and integral to the ignition switch, which is mounted on the steering column. The key-in ignition switch is

**Fig. 16 Switch In ON Position**

- 1 - IGNITION SWITCH
- 2 - ROTATE TO ON POSITION

## KEY-IN IGNITION SWITCH (Continued)

actuated by the ignition cylinder mechanism, and is hard wired between a body ground and the Body Control Module (BCM) through the instrument panel wire harness.

The key-in ignition switch cannot be adjusted or repaired and, if faulty or damaged, the entire ignition switch unit must be replaced. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL). For complete circuit diagrams, refer to **Body Control Module** in the Contents of Wiring Diagrams.

## OPERATION

The key-in ignition switch closes a path to ground for the BCM when the ignition key is inserted in the ignition cylinder, and opens the ground path when the key is removed from the ignition cylinder. The BCM monitors the key-in ignition switch status through an internal pull-up, then sends the proper switch status messages to other electronic modules over the Programmable Communications Interface (PCI) data bus network. The key-in ignition switch status is also used by the BCM as an input for chime warning system operation.

## DIAGNOSIS AND TESTING

## KEY-IN IGNITION SWITCH

For complete circuit diagrams, refer to **Body Control Module** in the Contents of Wiring Diagrams.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector from the key-in ignition switch connector receptacle on the ignition switch. Check for continuity between the key-in ignition switch sense and ground terminals of the key-in ignition switch connector receptacle. There should be continuity with the key inserted in the ignition cylinder, and no continuity with the key removed from the ignition cylinder. If OK, go to Step 2. If not OK, replace the faulty ignition switch unit.

(2) Check for continuity between the ground circuit cavity of the instrument panel wire harness connector for the key-in ignition switch and a good ground. There should be continuity. If OK, go to Step

3. If not OK, repair the open ground circuit to ground as required.

(3) Disconnect the gray 26-way instrument panel wire harness connector from the Body Control Module (BCM) connector receptacle. Check for continuity between the key-in ignition switch sense circuit cavity of the instrument panel wire harness connector for the key-in ignition switch and a good ground. There should be no continuity. If OK, go to Step 4. If not OK, repair the shorted key-in ignition switch sense circuit as required.

(4) Check for continuity between the key-in ignition switch sense circuit cavities of the instrument panel wire harness connector for the key-in ignition switch and the gray 26-way instrument panel wire harness connector for the BCM. There should be continuity. If OK, use a DRB scan tool and the proper Diagnostic Procedures manual to test the BCM. If not OK, repair the open key-in ignition switch sense circuit as required.

## KEY CYLINDER

## REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Disconnect negative battery cable at battery.
- (2) If equipped with an automatic transmission, place shifter in PARK position.
- (3) Rotate key to ON position.
- (4) A release tang is located on bottom of key cylinder (Fig. 18).

80a43756

**Fig. 18 Key Cylinder Release Tang**

- 1 - KEY CYLINDER  
2 - RELEASE TANG

## KEY CYLINDER (Continued)

80a43757

**Fig. 19 Key Cylinder and Cover Removal**

- 1 - LOWER COVER
- 2 - ACCESS HOLE
- 3 - PIN PUNCH
- 4 - COVER SCREWS (3)

(5) Position a small screwdriver or pin punch into tang access hole on bottom of steering column lower cover (Fig. 19).

(6) Push the pin punch up while pulling key cylinder from steering column.

**INSTALLATION**

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) If equipped with an automatic transmission, place shifter in PARK position.
- (2) Position key cylinder into steering column as it would normally be in the ON position.
- (3) Press key cylinder into column until it snaps into position.

(4) Check mechanical operation of switch. Be sure transmission lever is locked in PARK position after key removal. If key is difficult to rotate or is difficult to remove, the shift lever-to-steering column cable may be out of adjustment or defective. Refer to Transmission for procedures. If key can be removed, release lever mechanism may be defective. Release lever mechanism is not serviced separately. If repair is necessary, the steering column must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

(5) Connect negative cable to battery.

(6) Check electrical operation of switch.

**STEERING WHEEL****REMOVAL**

(1) Disable and remove the drivers side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(2) Partially remove the steering wheel bolt and leave the bolt in the column.

(3) Install puller C-3894-A or equivalent using the top of the bolt to push on. (Fig. 20)

80b6f088

**Fig. 20 STEERING WHEEL PULLER**

- 1 - PULLER C-3894-A
- 2 - STEERING WHEEL

## STEERING WHEEL (Continued)

**NOTE:** Ensure the puller jaws are seated in the pockets (Fig. 21) of the steering wheel armature.

- (4) Remove the steering wheel.

## INSTALLATION

**NOTE:** Do not reuse the old steering wheel bolt (a new bolt must be used)

- (1) Install steering wheel to the column

**NOTE:** Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

- (2) Install the new steering wheel bolt. Tighten the bolt to 54 N·m (40 ft. lbs.).

- (3) Install the drivers side air bag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

80b6f089

## GEAR

### DESCRIPTION

The power steering gear is a recirculating ball type gear (Fig. 1).

The following gear components can be serviced:

- Pitman Shaft and Cover
- Pitman Shaft Bearings
- Pitman Shaft Oil Seal/Dust Seal
- Stud Shaft Housing with Seal
- O-Rings and Teflon Rings

**NOTE:** If rack piston assembly is damaged the gear must be replaced.

### OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

### REMOVAL

**NOTE:** The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(1) Place the front wheels in the straight ahead position with the steering wheel centered and locked with a steering wheel lock.

(2) Remove the air cleaner housing,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Drain or siphon the power steering system.

(4) Remove the pressure and return lines (Fig. 2)from the steering gear. Refer to hose removal in this section.

(5) Remove the column coupler shaft bolt (Fig. 2)and remove the shaft from the gear.

(6) Raise and support the vehicle.

(7) Remove the left front wheel and tire assembly.

(8) Remove the pitman arm from gear with Puller C-4150A.

(9) Remove the windshield washer reservoir,(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).

(10) Remove the steering gear mounting bolts. Remove the steering gear out of the engine compartment (Fig. 3).

### INSTALLATION

(1) Position the steering gear on the frame rail and install the bolts. Tighten the bolts to 108 N·m (80 ft. lbs.) torque.

(2) Install the pitman arm and tighten nut to 251 N·m (185 ft. lbs.).

(3) Install windshield washer reservoir,(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).

(4) Install the wheel and tire assembly.

(5) Remove the support and lower the vehicle.

## GEAR (Continued)

- 12 - PITMAN SHAFT SEAL
- 13 - PLASTIC BACKUP WASHER
- 14 - METAL BACKUP WASHER
- 15 - RETAINING RING
- 16 - DUST SEAL

(6) Install the pressure and return hoses to the steering gear and tighten to 20-38 N·m (14-28 ft. lbs.).

(7) Install the column coupler shaft.

(8) Install the air cleaner housing.(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(9) Remove the steering wheel lock.

(10) Fill the power steering pump (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## ADJUSTMENTS

## STEERING GEAR

**NOTE:** Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

## GEAR (Continued)

**OVER-CENTER**

(1) Rotate the stub shaft with Socket 8343 from stop to stop and count the number of turns.

(2) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

(3) Place torque wrench and Socket 8343 in a vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 4). This is the Over-Center Rotating Torque.

**NOTE:** The stub shaft must rotate smoothly without sticking or binding.

(4) Rotate the stub shaft between 90° and 180° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.45-0.80 N·m (4-7 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

**NOTE:** To increase the Over-Center Rotating Torque turn the screw **CLOCKWISE**.

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 37-52 N·m (27-38 ft. lbs.).

## PITMAN SHAFT (Continued)

- (3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.
- (4) Install the oil seal with Driver 8294 and Handle C-4171.
- (5) Install plastic backup washer.

**NOTE:** The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

- (6) Install metal backup washer.
- (7) Install the retainer ring with snap ring pliers.
- (8) Coat the dust seal with **special grease** supplied with the new seal.
- (9) Install dust seal with Driver 8294 and Handle C-4171.
- (10) Install new pitman shaft cover o-ring.
- (11) Install pitman shaft assembly into the housing.
- (12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).
- (13) Perform over-center rotation torque adjustment.

## PITMAN SHAFT BEARING

## REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Rotate the stub shaft with a wrench (Fig. 5) from stop to stop and count the number of turns.
- (3) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

**NOTE:** The pitman shaft will not clear the housing if it is not centered.

- (4) Remove pitman shaft cover bolts and remove the shaft assembly (Fig. 6).
- (5) Remove pitman shaft cover o-ring.
- (6) Remove pitman shaft dust seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 7).
- (7) Remove the pitman shaft oil seal retaining ring with snap ring pliers (Fig. 8).
- (8) Remove oil seal metal backup washer then plastic backup washer from the housing (Fig. 12).
- (9) Remove pitman shaft oil seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 7).
- (10) Drop Driver 8277 through the top bearing and align the driver up with the lower bearing. (Fig. 9). Install Handle C-4171 into the driver and remove the lower bearing.
- (11) Turn the gear over and remove the upper bearing with Driver 8277 and Handle C-4171.

**Fig. 12 Backup Washers**

- 1 - METAL BACK UP WASHER  
2 - PLASTIC BACK UP WASHER

## INSTALLATION

- (1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 10). Drive bearing into housing until the driver bottoms out.

**NOTE:** Install upper pitman shaft bearing with the part number/letters facing the driver.

- (2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 11). Drive bearing into housing until the bearing shoulder is seated against the housing.
- (3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.
- (4) Install the oil seal with Driver 8294 and Handle C-4171.
- (5) Install plastic backup washer.

**NOTE:** The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

- (6) Install metal backup washer.
- (7) Install the retainer ring with snap ring pliers.
- (8) Coat the dust seal with **special grease** supplied with the new seal.
- (9) Install dust seal with Driver 8294 and Handle C-4171.
- (10) Install new pitman shaft cover o-ring.
- (11) Install pitman shaft assembly into the housing.
- (12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).
- (13) Perform over-center rotation torque adjustment.

## PITMAN SHAFT SEAL

### REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Rotate the stub shaft with a wrench (Fig. 5) from stop to stop and count the number of turns.
- (3) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

**NOTE: The pitman shaft will not clear the housing if it is not centered.**

- (4) Remove pitman shaft cover bolts and remove the shaft assembly (Fig. 6).
- (5) Remove pitman shaft cover o-ring.
- (6) Remove pitman shaft dust seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 7).
- (7) Remove the pitman shaft oil seal retaining ring with snap ring pliers (Fig. 8).
- (8) Remove oil seal metal backup washer then plastic backup washer from the housing (Fig. 12).
- (9) Remove pitman shaft oil seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 7).
- (10) Drop Driver 8277 through the top bearing and align the driver up with the lower bearing. (Fig. 9). Install Handle C-4171 into the driver and remove the lower bearing.
- (11) Turn the gear over and remove the upper bearing with Driver 8277 and Handle C-4171.

### INSTALLATION

- (1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 10). Drive bearing into housing until the driver bottoms out.

**NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.**

- (2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 11). Drive bearing into housing until the bearing shoulder is seated against the housing.
- (3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.
- (4) Install the oil seal with Driver 8294 and Handle C-4171.
- (5) Install plastic backup washer.

**NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.**

- (6) Install metal backup washer.

- (7) Install the retainer ring with snap ring pliers.
- (8) Coat the dust seal with **special grease** supplied with the new seal.
- (9) Install dust seal with Driver 8294 and Handle C-4171.
- (10) Install new pitman shaft cover o-ring.
- (11) Install pitman shaft assembly into the housing.
- (12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).
- (13) Perform over-center rotation torque adjustment.

## RACK PISTON/VALVE ASSEMBLY

### REMOVAL

- (1) Remove the steering gear (Refer to 19 - STEERING/GEAR - REMOVAL).
- (2) Clean exposed end of pitman shaft and housing with a wire brush.
- (3) Rotate the stub shaft with a wrench (Fig. 5) from stop to stop and count the number of turns.
- (4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

**NOTE: The pitman shaft will not clear the housing if it is not centered.**

- (5) Remove pitman shaft cover bolts and remove the shaft assembly (Fig. 6).
- (6) Remove the pitman shaft cover o-ring.
- (7) Remove stub shaft housing bolts (Fig. 13).

80b5cb06

**Fig. 13 Stub Shaft Housing**

- 1 - STUB SHAFT HOUSING
- 2 - BOLTS
- 3 - STUB SHAFT

## RACK PISTON/VALVE ASSEMBLY (Continued)

(8) Remove the housing from the stub shaft (Fig. 14).

**Fig. 14 Housing Removal**

- 1 - STEERING GEAR  
2 - STUB SHAFT HOUSING

(9) Remove stub shaft housing o-rings (Fig. 15).

**Fig. 15 O-Rings**

- 1 - LARGE O-RING  
2 - SMALL O-RING

(10) Remove the rack piston/valve assembly retaining ring with snap ring pliers (Fig. 16).

(11) Pull the rack piston/valve assembly out of the gear housing (Fig. 17).

**NOTE:** If the rack piston is damage the gear assembly must be replaced.

(12) Remove teflon rings and o-ring (Fig. 18) from the rack piston/valve assembly.

**CAUTION:** The rack piston teflon ring and o-ring must be replaced whenever the assembly is removed from the housing.

**Fig. 16 Retaining Ring**

- 1 - SNAP RING

**Fig. 17 Rack Piston/Valve Assembly**

- 1 - STEERING GEAR  
2 - RACK PISTON/VALVE ASSEMBLY

## INSTALLATION

(1) Lubricate new o-ring and teflon rings with power steering fluid and install on the rack piston/valve assembly.

(2) Lubricate the rack piston/valve assembly with power steering fluid.

(3) Slide the assembly into the gear housing.

(4) Install new stub shaft housing o-rings and install the housing. Tighten the housing bolts to 62 N·m (46 ft. lbs.).

(5) Install new o-ring on the pitman shaft cover.

(6) Install the pitman shaft into the gear housing.

(8) Perform over-center rotation torque adjustment (Refer to 19 - STEERING/GEAR - ADJUSTMENTS)..

(9) Install the steering gear (Refer to 19 - STEERING/GEAR - INSTALLATION).

(10) Fill the power steering pump (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## STUB SHAFT HOUSING

## REMOVAL

**NOTE:** If stub shaft housing, seal or bearing is damaged the housing must be replaced.

- (1) Remove the steering gear (Refer to 19 - STEERING/GEAR - REMOVAL).
- (2) Remove stub shaft housing bolts (Fig. 19).
- (3) Remove housing from the steering gear (Fig. 20).
- (4) Remove stub shaft housing o-rings (Fig. 15).

## INSTALLATION

**NOTE:** If stub shaft housing, seal or bearing is damaged the housing must be replaced.

- (1) Grease stub shaft seal with **special grease**-supplied with new stub shaft housing.
- (2) Install new stub shaft housing o-rings.
- (3) Install housing on the steering gear.
- (4) Install the housing bolts and tighten to 62 N·m ( 46 ft. lbs.).

80b4b857

LINKAGE

DESCRIPTION

STEERING LINKAGE – RIGHT HAND DRIVE (RHD) VEHICLES

Vehicles equipped with right hand drive (RHD) steering utilize the same components of left hand drive vehicles. The RHD Steering linkage is designed as a mirror image of left hand drive linkage with the exception of the steering damper (Fig. 1), which is mounted on the same side of the vehicle whether RHD or LHD. See figure below for reference. All specifications are the same as LHD. Refer to Group 19, Steering of the gasoline engine service manual for additional information.

DESCRIPTION

The steering linkage consists of a pitman arm, drag link, tie rod, and steering dampener (Fig. 2). An adjustment sleeve on the tie rod is used to set wheel toe position. The sleeve on the drag link is used for steering wheel centering.

**CAUTION:** If any steering components are replaced or serviced an alignment must be performed, to ensure the vehicle meets all alignment specifications.

**CAUTION:** Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

## DAMPER

### DESCRIPTION

The damper is mounted to the axle housing and the tie rod end. The damper consists of steel tube shock absorber with a permanent bushed end.

### OPERATION

The steering damper provides steering system damping.

### REMOVAL

- (1) Remove the nut from the ball stud at the tie rod.
- (2) Remove the steering damper from the tie rod.
- (3) Remove the steering damper nut and bolt from the axle bracket (Fig. 3).

**Fig. 3 Steering Damper**

- 1 - DAMPER  
2 - TIE ROD

### INSTALLATION

- (1) Install the steering damper to the axle bracket and tie rod.
- (2) Install the steering damper bolt in the axle bracket and tighten bolt to 88 N·m (65 ft. lbs.).
- (3) Install the nut at the tie rod and tighten to 41 N·m (30 ft. lbs.).

## DRAG LINK

### DESCRIPTION

The drag link and ends are comprised of two forged ends connected by a steel adjusting tube. The drag link connects the steering gear pitman arm to the steering knuckle. The larger offset end is attached to the pitman arm.

### OPERATION

The sleeve is used for steering wheel centering.

### REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove right wheel and tire assembly.
- (3) Remove the cotter pins and nuts at the right steering knuckle and pitman arm (Fig. 4).
- (4) Remove the drag link from the steering knuckle and pitman arm Puller C-3894-A.
- (5) Loosen adjustment sleeve clamp bolts and unscrew the tie rod ends from the adjustment sleeve.

**Fig. 4 Drag Link**

- 1 - STEERING GEAR  
2 - PITMAN ARM  
3 - CLAMP  
4 - DRAG LINK  
5 - CLAMP

### INSTALLATION

- (1) Screw the tie rod ends into the adjustment sleeve.
- (2) Install the drag link onto the right steering knuckle and pitman arm.
- (3) Tighten the nut at the steering knuckle to 47 N·m (35 ft. lbs.). Tighten the pitman nut to 88 N·m (65 ft. lbs.). Install new cotter pins.
- (4) Position clamp bolts to their original position and tighten to 41 N·m (30 ft. lbs.).
- (5) Install right wheel and tire assembly.
- (6) Remove support and lower the vehicle.
- (7) Center the steering wheel.

## PITMAN ARM

### DESCRIPTION

The pitman arm is attached at one end of the steering gear's sector shaft. The other end is connected to the drag link.

### OPERATION

The pitman arm transfers rotary motion into side to side motion.

### REMOVAL

- (1) Remove the cotter pin and nut from the drag link at the pitman arm (Fig. 5).
- (2) Remove the drag link ball stud from the pitman arm with a puller.
- (3) Remove the nut and washer from the steering gear shaft. Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from steering gear with Puller C-4150A.

80c0722a

**Fig. 5 Pitman Arm**

- 1 - STEERING GEAR
- 2 - PITMAN ARM

### INSTALLATION

- (1) Align and install the pitman arm on steering gear shaft.
- (2) Install the washer and nut on the shaft and tighten the nut to 251 N·m (185 ft. lbs.).
- (3) Install drag link ball stud to pitman arm. Install nut and tighten to 88 N·m (65 ft. lbs.). Install a new cotter pin.

## TIE ROD END

### DESCRIPTION

The ends are forged, with a lubed for life ball socket.

### OPERATION

The tie rod ends connect the drag link to the wheel assembly. The tie rod provides toe alignment and transfers steering input from the drag link to the wheels.

### REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove wheel and tire assemblies.
- (3) Remove the damper nut from the tie rod clamp (Fig. 6).
- (4) Remove the damper from the tie rod.
- (5) Remove the cotter pins and nuts from the tie rod ends at the steering knuckles (Fig. 6).
- (6) Remove the tie rod ends from the steering knuckles with Puller C-3894-A..
- (7) Loosen the adjustment sleeve clamp bolts and unscrew the tie rod ends from the sleeve.

80c07229

**Fig. 6 Tie Rod Assembly**

- 1 - TIE ROD END
- 2 - CLAMP
- 3 - DAMPER
- 4 - TIE ROD
- 5 - CLAMP
- 6 - TIE ROD END

### INSTALLATION

- (1) Screw the tie rod ends into the adjustment sleeve.
- (2) Install the tie rod on the steering knuckles and install the nuts.
- (3) Tighten the nuts to 47 N·m (35 ft. lbs.). Install new cotter pins and bend end 60°.
- (4) Position the adjustment sleeve clamp bolts to their original location and tighten to 41 N·m (30 ft. lbs.).
- (5) Install the damper on the tie rod and install the nut.
- (6) Tighten the nut to 41 N·m (30 ft. lbs.). Install new cotter pins and bend end 60°.
- (7) Install wheel and tire assemblies.
- (8) Remove support and lower the vehicle.
- (9) Perform toe position adjustment.

## PUMP

### DESCRIPTION - 4.0L, 4.7L

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (Fig. 1) and (Fig. 2). The pump shaft has a pressed-on drive pulley that is belt driven by the crankshaft pulley.

**Fig. 1 Pump With Integral Reservoir**

- 1 - CAP
- 2 - FLUID RESERVOIR (TYPICAL)
- 3 - HIGH-PRESSURE FITTING

- 6 - PUMP BODY
- 7 - HIGH PRESSURE FITTING

pump. The reservoir is attached to the pump body with spring clips. The power steering pump is used to drive the hydraulic engine cooling fan, which separates the flow to the fan gerotors and the power steering gear. The power steering pump is connected to the engine cooling fan by pressure and return hoses and the pump is connected to the steering gear via a return hose from the steering cooler (Fig. 2).

## PUMP (Continued)

**NOTE:** Power steering pumps have different pressure rates and are not interchangeable with other pumps.

## OPERATION - 4.0L

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure. The reservoir is attached to the pump body with spring clips. The power steering pump is connected to the steering gear by the pressure and return hoses (Fig. 1).

**NOTE:** Power steering pumps have different pressure rates and are not interchangeable with other pumps.

## DIAGNOSIS AND TESTING - PUMP LEAKAGE

(1) Possible areas of pump leakage (Fig. 3).

1. BUSHING (BEARING) WORN, SEAL WORN. REPLACE PUMP.
2. REPLACE RESERVOIR O-RING SEAL.
3. TORQUE HOSE FITTING NUT TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE O-RING SEAL.
4. TORQUE FITTING TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE O-RING SEAL.
5. REPLACE PUMP.
6. CHECK OIL LEVEL: IF LEAKAGE PERSISTS WITH THE LEVEL CORRECT AND CAP TIGHT, REPLACE THE CAP.

80a1c3c3

**Fig. 3 4.0L Power Steering Pump**

## STANDARD PROCEDURE

STANDARD PROCEDURE - INITIAL OPERATION  
- 4.0L

**WARNING:** THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

**CAUTION:** Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

(1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.

(2) Start the engine and let run for a few seconds then turn engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(4) Raise the front wheels off the ground.

(5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.

(6) Check the fluid level add if necessary.

(7) Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.

(8) Stop the engine and check the fluid level and refill as required.

(9) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

**CAUTION:** Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

STANDARD PROCEDURE - INITIAL OPERATION  
- 4.7L

**WARNING:** THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

**NOTE:** Remove as much of the old fluid out of the system as possible with a suction tool or by removing a hose, When a component has failed. Then refill it with fresh fluid until it is clean. This may have to be done more than once.

**CAUTION:** Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

## PUMP (Continued)

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

(1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.

(2) Start the engine and let run for a few seconds then turn engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(4) Raise the front wheels off the ground.

(5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.

(6) Check the fluid level add if necessary.

(7) Lower the vehicle, start the engine, and use the DRB III to activate the hydraulic fan on full fan operation.

(8) Turn the steering wheel slowly from lock to lock.

(9) Stop the engine, check the fluid level and refill as required and repeat the process

**CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.**

(10) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

(11) While the vehicle is in park, use the DRB III to activate the hydraulic fan to full fan operation and briefly rev the engine up to 3000 rpm to fully engage the hydraulic fan.

(12) Check the fluid level add if necessary.

## REMOVAL

## REMOVAL - 4.0L ENGINE

(1) Remove serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove pressure and return hoses from pump and drain the pump.

(3) Loosen the pump bracket bolt at the engine block.

(4) Remove 3 pump mounting bolts (Fig. 4) through pulley access holes.

(5) Tilt pump downward and remove from engine.

(6) Remove pulley from pump.

## REMOVAL - 4.7L ENGINE

(1) Remove the serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove the pressure and return hoses from pump and drain pump.

80bfe10e

2 - PUMP

## PUMP (Continued)

**REMOVAL - 2.7L DIESEL**

- (1) Open the hood and disconnect the negative battery cable.
- (2) Remove the intercooler outlet hose from the vehicle.
- (3) Remove the battery. Refer to the electrical section.
- (4) Siphon and drain the fluid from the pump.
- (5) Remove the accessory drive belt from the power steering pump pulley. Refer to Cooling System for the procedure.
- (6) Install a allen wrench in the power steering pump center shaft to hold the pump in position. Remove the (3) power steering pump pulley retaining bolts (Fig. 6).

**Fig. 6 Installing Power Steering Pump Pulley**

- 1 - POWER STEERING PUMP
- 2 - ALLEN WRENCH HOLDING PUMP CENTER SHAFT
- 3 - POWER STEERING PUMP PULLEY

- (7) Remove the power steering pump pulley from the pump.
- (8) Remove the power steering fluid supply hose from the pump (Fig. 7).
- (9) Remove the power steering fluid pressure line from the pump (Fig. 7).
- (10) Remove the power steering pump to the mount and remove the pump from the vehicle.

**INSTALLATION****INSTALLATION - 4.0L ENGINE**

- (1) Install pulley on pump.
- (2) Install pump on the engine mounting bracket.

**Fig. 7 Diesel Power Steering Pump Position & Orientation**

- 1 - POWER STEERING PUMP
- 2 - POWER STEERING FLUID SUPPLY HOSE
- 3 - POWER STEERING FLUID PRESSURE LINE
- 4 - POWER STEERING PUMP PULLEY
- 5 - POWER STEERING PUMP PULLEY RETAINING BOLTS

- (3) Install 3 pump mounting bolts and tighten to 27 N·m (20 ft. lbs.).
- (4) Tighten pump bracket bolt to 57 N·m (42 ft. lbs.).
- (5) Install the pressure line on the pump and tighten to 28 N·m (21 ft. lbs.).
- (6) Install the return hoses on pump.
- (7) Install the drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (8) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - 4.7L ENGINE**

- (1) Position the pump on the left cylinder head and install bolts through pulley access holes. Tighten bolts to 28 N·m (21 ft. lbs.).
- (2) Install the pressure and return hoses to pump.
- (3) Install serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (4) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## PUMP (Continued)

**INSTALLATION - 2.7L DIESEL**

**CAUTION:** Power steering system fluid may be contaminated with metal shavings, overheated or improper fluid. All fluid should be drained from the system. After any component replacement, system should be flushed and filled with Mopar Power Steering fluid, or equivalent.

(1) Position the pump to the pump mount and install the retaining bolts. Torque the bolts to 27 N·m (20 ft. lbs.).

(2) Install the power steering fluid pressure line on the pump. Torque the nut to 24 N·m (18 ft. lbs.). Be certain the sealing o-ring is lubricated and free of tears.

(3) Install the power steering fluid supply hose on the pump.

(4) Install the power steering pump pulley on the pump. Torque the retaining bolts to 27 N·m (20 ft. lbs.). Use the allen wrench to hold the pump from rotating.

(5) Install the accessory drive belt on the power steering pump pulley. Refer to Cooling System for the procedure.

(6) Install the battery.

(7) Install the intercooler outlet hose on the vehicle.

(8) Connect the negative battery cable.

(9) Fill the power steering fluid. Refer to - Power Steering Pump Initial Operation - in this group for the procedure.

## FLUID COOLER

## DESCRIPTION

4.7L models of this vehicle are equipped with a cooler for the power steering system fluid. The power steering fluid cooler is located at the front of the vehicle. It is mounted to the radiator support just forward of the air-conditioning condenser and just rearward of the front fascia (Fig. 8). The cooler is positioned so it is in the air flow through the front fascia of the vehicle.

80bd4ed2

**Fig. 8 POWER STEERING FLUID COOLER**

- 1 - POWER STEERING COOLER
- 2 - POWER STEERING COOLER LINES CLIP

## REMOVAL

- (1) Disconnect negative battery cable at battery.
- (2) Drain the power steering fluid out of the reservoir.
- (3) Remove the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (4) Remove the grille opening reinforcement panel.
- (5) Place a drain pan under the cooler.
- (6) Disconnect the lower hose at cooler (Fig. 8).
- (7) Disconnect the upper hose at cooler (Fig. 8).
- (8) Remove the three cooler mounting bolts (Fig. 8).
- (9) Remove the cooler from the vehicle.

## FLUID COOLER (Continued)

**INSTALLATION**

- (1) Position and install the power steering cooler to the vehicle.
- (2) Install the three mounting bracket bolts (Fig. 8).
- (3) Reconnect the upper hose at cooler (Fig. 8).
- (4) Reconnect the lower hose at cooler (Fig. 8).
- (5) Connect negative battery cable to battery.
- (6) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
- (7) Start engine and check for leaks.
- (8) Install the grille opening reinforcement panel
- (9) Install the front fascia grille,(Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

**HOSES - 4.0L****DESCRIPTION****DESCRIPTION - PRESSURE LINE**

The hose consists of two metal ends and rubber center section that contains a tuning cable. The pump end uses a quick connect fitting. Lubrication must be used on the quick connect nut and o-ring when installing.

**DESCRIPTION - RETURN LINE**

Power steering return line is a hose which is clamped at the pump and the gear.

**OPERATION****OPERATION - PRESSURE LINE**

Power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the power steering gear on the 4.0L. The 4.7L power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the engine cooling fan and the steering gear.

**OPERATION - RETURN LINE**

Power steering return line, is used to transfer low pressure power steering fluid, from the power steering gear to the power steering pump.

**REMOVAL**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Disconnect the power steering pressure hose from the power steering pump and then the power steering gear (Fig. 9).
- (4) Disconnect the power steering return hose from the power steering cooler and the reservoir.

809e92d2

**Fig. 9 POWER STEERING HOSES**

- 1 - RETURN HOSE
- 2 - HIGH PRESSURE HOSE
- 3 - STEERING GEAR

- (5) Remove the hoses from the vehicle.

**INSTALLATION**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the power steering return hose to the power steering cooler and the reservoir.
- (3) Reconnect the power steering pressure hose to the power steering pump and then the power steering gear.
- (4) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (5) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## HOSES - 4.7L

### DESCRIPTION

#### DESCRIPTION - 1/2" PRESSURE HOSE

The hose consists of two metal ends and a rubber center with quick connect nuts at both ends. The hose connects the power steering pump to the hydraulic fan motor and is clipped to the fan shroud (Fig. 10). Lubrication must be used on the quick connect nuts and o-rings when installing.

**Fig. 10 1/2" PRESSURE HOSE**

- 1 - 1/2" PRESSURE HOSE
- 2 - POWER STEERING PUMP
- 3 - STEERING GEAR

80be71ab

#### DESCRIPTION - 1/2" RETURN HOSE

The fan motor return line is a molded rubber hose that is clamped at the hydraulic motor and the power steering reservoir (Fig. 11).

**Fig. 11 1/2" RETURN HOSE**

- 1 - 1/2" RETURN HOSE
- 2 - HOSE CLAMP

80be71bc

#### DESCRIPTION - 3/8" PRESSURE HOSE

The hose consists of two metal ends and two rubber sections one of which contains a tuning cable (Fig. 12). The hose is clipped in two places to the fan shroud. Lubrication must be used on the o-rings when installing.

80be7221

**Fig. 12 3/8" PRESSURE HOSE**

- 1 - 3/8" PRESSURE HOSE
- 2 - STEERING GEAR

#### DESCRIPTION - 3/8" GEAR OUTLET HOSE

The gear outlet line consists of a metal section that connects to the gear and a rubber section that clamps to the steering cooler inlet tube (Fig. 13).

80be7225

**Fig. 13 3/8" GEAR OUTLET HOSE**

- 1 - HOSE CLAMP
- 2 - 3/8" GEARR OUTLET HOSE

## HOSES - 4.7L (Continued)

**DESCRIPTION - 3/8" RETURN HOSE**

The return hose is a formed rubber hose that connects the steering cooler outlet tube to the power steering reservoir (Fig. 14). It is clamped at both ends.

**Fig. 14 3/8" RETURN HOSE**

- 1 - HOSE CLAMP  
2 - 3/8" RETURN HOSE  
3 - HYDRAULIC COOLING FAN MOTOR

**OPERATION****OPERATION - 1/2" PRESSURE HOSE**

The 1/2" pressure hose is used to transfer high pressure power steering fluid from the power steering pump to the engine cooling fan motor (Fig. 10).

**OPERATION - 1/2" RETURN HOSE**

The power steering return line returns low pressure excess flow from the hydraulic fan motor back to the power steering pump (Fig. 11).

**OPERATION - 3/8" PRESSURE HOSE**

High pressure power steering fluid is transmitted from the hydraulic fan motor to the steering gear by the 3/8" steering line.

**OPERATION - 3/8" GEAR OUTLET HOSE**

The gear outlet hose transmits power steering fluid under moderate low pressure to the power steering cooler inlet tube.

**OPERATION - 3/8" RETURN HOSE**

Low pressure power steering fluid is transmitted from the steering cooler back to the power steering pump by the 3/8" return hose.

**REMOVAL****REMOVAL - 1/2" PRESSURE HOSE**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box, (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Raise and support the vehicle.
- (4) Remove the metal skid plate.
- (5) Disconnect the high pressure hose from the hydraulic fan motor (Fig. 10).
- (6) Disconnect the high pressure hose from the power steering pump (Fig. 10).
- (7) Remove the hose from the clipped position on the fan shroud.
- (8) Remove the hose from the vehicle.

**REMOVAL - 1/2" RETURN HOSE**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box, (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Raise and support the vehicle.
- (4) Remove the metal skid plate.
- (5) Disconnect the rubber return hose from the hydraulic fan motor (Fig. 11).
- (6) Disconnect the rubber return hose from the power steering reservoir (Fig. 11).
- (7) Remove the hose from the vehicle.

**REMOVAL - 3/8" PRESSURE HOSE**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box, (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Raise and support the vehicle.
- (4) Remove the metal skid plate.
- (5) Disconnect the high pressure hose from the hydraulic fan motor (Fig. 12).
- (6) Disconnect the high pressure hose from the power steering gear (Fig. 12).
- (7) Remove the hose from the clipped position on the fan shroud.
- (8) Remove the hose from the vehicle.

**REMOVAL - 3/8" RETURN HOSE**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box, (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Raise and support the vehicle.

## HOSES - 4.7L (Continued)

- (4) Disconnect the rubber hose from the steering cooler outlet tube (Fig. 14).
- (5) Disconnect the rubber hose from the power steering reservoir (Fig. 14).
- (6) Remove the hose from the vehicle.

**REMOVAL - 3/8" GEAR OUTLET HOSE**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Raise and support the vehicle.
- (4) Disconnect the rubber hose from the steering cooler inlet tube (Fig. 13).
- (5) Disconnect the metal tube from the power steering gear (Fig. 13).
- (6) Remove the hose from the vehicle.

**REMOVAL - INLET COOLER HOSE**

- (1) Disconnect negative battery cable at battery.
- (2) Drain the power steering fluid out of the reservoir.
- (3) Remove the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (4) Remove the front fascia grille assembly,(Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (5) Remove the grille opening reinforcement panel
- (6) Place a drain pan under the cooler.
- (7) Disconnect the lower hose at cooler.
- (8) Disconnect the cooler hose at the gear.
- (9) Remove the bracket holding the cooler hoses (Fig. 15).
- (10) Remove the cooler hose from the vehicle.

- (4) Remove the front fascia grille assembly,(Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (5) Remove the grille opening reinforcement panel
- (6) Place a drain pan under the cooler.
- (7) Disconnect the upper hose at cooler.
- (8) Disconnect the cooler hose at the reservoir.
- (9) Remove the bracket holding the cooler hoses (Fig. 15).
- (10) Remove the cooler hose from the vehicle.

**INSTALLATION****INSTALLATION - 1/2" PRESSURE HOSE**

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the high pressure hose to the power steering pump (Fig. 10) Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (3) Reconnect the high pressure hose to the hydraulic fan motor (Fig. 10) Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (4) Install the hose to the clipped position on the fan shroud.
- (5) Install the metal skid plate.
- (6) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (7) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - 1/2" RETURN HOSE**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the rubber return hose to the power steering reservoir (Fig. 11) Tighten the hose clamp.
- (3) Reconnect the rubber return hose to the hydraulic fan motor (Fig. 11) Tighten the hose.
- (4) Install the metal skid plate.
- (5) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (6) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## HOSES - 4.7L (Continued)

**INSTALLATION - 3/8" PRESSURE HOSE**

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the high pressure hose to the hydraulic fan motor (Fig. 12) Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (3) Reconnect the high pressure hose to the power steering gear (Fig. 12) Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (4) Install the hose to the clipped position on the fan shroud.
- (5) Install the metal skid plate.
- (6) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (7) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - 3/8" RETURN HOSE**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the rubber hose to the steering cooler outlet tube (Fig. 14) Tighten the hose clamp.
- (3) Reconnect the rubber hose to the power steering reservoir (Fig. 14) Tighten the hose clamp.
- (4) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (5) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - 3/8" GEAR OUTLET HOSE**

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hoses to the vehicle.
- (2) Reconnect the rubber hose to the steering cooler inlet tube (Fig. 13) Tighten the hose clamp.
- (3) Reconnect the metal tube to the power steering gear (Fig. 13) Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (4) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (5) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - INLET COOLER HOSE**

- (1) Install the cooler hose to the vehicle.
- (2) Reconnect the cooler hose at the gear.

- (3) Reconnect the lower hose at cooler. Tighten the hose to 22.5 N·m (17 ft.lbs.)

- (4) Install the bracket holding the cooler hoses (Fig. 15).

- (5) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

- (6) Install the grille opening reinforcement panel
- (7) Install the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

- (8) Reconnect negative battery cable at battery.
- (9) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - OUTLET COOLER HOSE**

- (1) Install the cooler hose to the vehicle.
- (2) Reconnect the cooler hose at the reservoir.
- (3) Reconnect the upper hose at the cooler. Tighten the hose to 22.5 N·m (17 ft. lbs.)
- (4) Install the bracket holding the cooler hoses (Fig. 15). Tighten the bracket to 22.5 N·m (17 ft. lbs.)
- (5) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (6) Install the grille opening reinforcement panel
- (7) Install the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
- (8) Reconnect negative battery cable at battery.
- (9) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**HOSES - 2.7L DIESEL****REMOVAL****REMOVAL - PRESSURE HOSE - PUMP TO THE HYDRAULIC FAN MODULE (2.7L DIESEL)**

- (1) Drain the power steering fluid from the reservoir.
- (2) Raise and support the vehicle.
- (3) Remove the metal skid plate.
- (4) Disconnect the high pressure hose from the hydraulic fan motor.
- (5) Lower the vehicle.
- (6) Disconnect the high pressure hose from the power steering pump.
- (7) Remove the hose from the clipped position on the fan shroud.
- (8) Remove the hose from the vehicle.

## HOSES - 2.7L DIESEL (Continued)

**REMOVAL - RETURN HOSE - RESERVOIR TO THE HYDRAULIC FAN MODULE (2.7L DIESEL)**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the battery.
- (3) Remove the front fascia. Refer to the body section.
- (4) Remove the power steering reservoir. Refer to reservoir removal in this section.
- (5) Disconnect the rubber return hose from the power steering reservoir.
- (6) Raise and support the vehicle.
- (7) Remove the metal skid plate.
- (8) Disconnect the rubber return hose from the hydraulic fan motor.
- (9) Remove the hose from the vehicle.

**REMOVAL - PRESSURE HOSE - GEAR TO THE HYDRAULIC FAN MODULE (2.7L DIESEL)**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the battery.
- (3) Remove the battery tray.
- (4) Remove the front fascia. Refer to the body section.
- (5) Remove the power steering reservoir. Refer to reservoir removal in this section.
- (6) Disconnect the high pressure hose from the power steering gear.
- (7) Remove the hose from the clipped position on the fan shroud.
- (8) Raise and support the vehicle.
- (9) Remove the metal skid plate.
- (10) Disconnect the high pressure hose from the hydraulic fan motor.
- (11) Remove the hose from the vehicle.

**REMOVAL - RETURN HOSE - RESERVOIR TO THE PUMP (2.7L DIESEL)**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the battery.
- (3) Disconnect the rubber hose from the power steering pump.
- (4) Disconnect the rubber hose from the power steering reservoir.
- (5) Remove the hose from the vehicle.

**REMOVAL - 3/8" GEAR OUTLET HOSE (2.7L DIESEL)**

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the battery.
- (3) Remove the battery tray.

- (4) Remove the front fascia. Refer to the body section.
- (5) Remove the power steering reservoir. Refer to reservoir removal in this section.
- (6) Disconnect the rubber hose from the steering cooler inlet tube.
- (7) Disconnect the metal tube from the power steering gear.
- (8) Remove the hose from the vehicle.

**REMOVAL - INLET COOLER HOSE (2.7L DIESEL)**

- (1) Disconnect negative battery cable at battery.
- (2) Drain the power steering fluid out of the reservoir.
- (3) Remove the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (4) Remove the grille opening reinforcement panel
- (5) Place a drain pan under the cooler.
- (6) Disconnect the lower hose at cooler.
- (7) Disconnect the cooler hose at the gear.
- (8) Remove the bracket holding the cooler hoses (Fig. 16).
- (9) Remove the cooler hose from the vehicle.

80be81fc

**Fig. 16 COOLER HOSES MOUNTING BRACKET**

- 1 - RADIATOR
- 2 - COOLER HOSES MOUNTING BRACKET
- 3 - COOLER HOSE

**REMOVAL - OUTLET COOLER HOSE (2.7L DIESEL)**

- (1) Disconnect negative battery cable at battery.
- (2) Drain the power steering fluid out of the reservoir.
- (3) Remove the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (4) Remove the grille opening reinforcement panel
- (5) Place a drain pan under the cooler.

## HOSES - 2.7L DIESEL (Continued)

- (6) Disconnect the upper hose at cooler.
- (7) Disconnect the cooler hose at the reservoir.
- (8) Remove the bracket holding the cooler hoses (Fig. 16).
- (9) Remove the cooler hose from the vehicle.

## INSTALLATION

## INSTALLATION - PRESSURE HOSE PUMP TO THE HYDRAULIC FAN MODULE (2.7L DIESEL)

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hose to the vehicle.
- (2) Reconnect the high pressure hose to the power steering pump. Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (3) Install the hose to the clipped position on the fan shroud.
- (4) Raise and support the vehicle.
- (5) Reconnect the high pressure hose to the hydraulic fan motor. Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (6) Install the metal skid plate.
- (7) Remove the support and lower the vehicle.
- (8) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## INSTALLATION - RETURN HOSE - RESERVOIR TO THE HYDRAULIC FAN MODULE (2.7L DIESEL)

- (1) Install the hose to the vehicle.
- (2) Reconnect the rubber return hose to the hydraulic fan motor. Tighten the hose.
- (3) Install the metal skid plate.
- (4) Reconnect the rubber return hose to the power steering reservoir. Tighten the hose clamp.
- (5) Remove the support and lower the vehicle.
- (6) Install the power steering reservoir. Refer to the reservoir installation in this section.
- (7) Install the front fascia. Refer to the body section.
- (8) Install the battery
- (9) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## INSTALLATION - PRESSURE HOSE - GEAR TO HYDRAULIC FAN MODULE (2.7L DIESEL)

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hose to the vehicle.
- (2) Reconnect the high pressure hose to the hydraulic fan motor. Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (3) Install the metal skid plate.
- (4) Remove the support and lower the vehicle.
- (5) Reconnect the high pressure hose to the power steering gear. Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (6) Install the hose to the clipped position on the fan shroud.
- (7) Install the battery tray.
- (8) Install the power steering reservoir. Refer to the reservoir installation in this section.
- (9) Install the front fascia. Refer to the body section.
- (10) Install the battery
- (11) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## INSTALLATION - RETURN HOSE - RESERVOIR TO THE PUMP (2.7L DIESEL)

- (1) Install the hose to the vehicle.
- (2) Reconnect the rubber hose to the power steering pump. Tighten the hose clamp.
- (3) Reconnect the rubber hose to the power steering reservoir. Tighten the hose clamp.
- (4) Install the battery.
- (5) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## INSTALLATION - 3/8" GEAR OUTLET HOSE (2.7L DIESEL)

**NOTE: Lubrication and a new o-ring must be used when reinstalling.**

- (1) Install the hose to the vehicle.
- (2) Reconnect the rubber hose to the steering cooler inlet tube. Tighten the hose clamp.
- (3) Reconnect the metal tube to the power steering gear. Tighten the hose to 22.5 N·m (17 ft.lbs.).
- (4) Install the battery tray.
- (5) Install the power steering reservoir. Refer to the reservoir installation in this section.
- (6) Install the front fascia. Refer to the body section.
- (7) Install the battery
- (8) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## HOSES - 2.7L DIESEL (Continued)

**INSTALLATION - INLET COOLER HOSE (2.7L DIESEL)**

- (1) Install the cooler hose to the vehicle.
- (2) Reconnect the cooler hose at the gear.
- (3) Reconnect the lower hose at cooler. Tighten the hose to 22.5 N·m (17 ft.lbs.)
- (4) Install the bracket holding the cooler hoses (Fig. 16).
- (5) Install the grille opening reinforcement panel
- (6) Install the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
- (7) Reconnect negative battery cable at battery.
- (8) Refill the power steering fluid and bleed the system, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**INSTALLATION - OUTLET COOLER HOSE (2.7L DIESEL)**

- (1) Install the cooler hose to the vehicle.
- (2) Reconnect the cooler hose at the reservoir.
- (3) Reconnect the upper hose at the cooler. Tighten the hose to 22.5 N·m (17 ft. lbs.)
- (4) Install the bracket holding the cooler hoses (Fig. 16). Tighten the bracket to 22.5 N·m (17 ft. lbs.)
- (5) Install the grille opening reinforcement panel
- (6) Install the front fascia grille assembly, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
- (7) Reconnect negative battery cable at battery.
- (8) Refill the power steering fluid and bleed the system, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

**PULLEY****REMOVAL****REMOVAL**

**CAUTION:** On vehicles equipped with the 4.0L or 4.7L, Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

- (1) Remove pump assembly.
- (2) Remove pulley from pump with Puller C-4333 or equivalent puller (Fig. 17).

**REMOVAL - 2.7L DIESEL**

- (1) Open the hood and disconnect the negative battery cable.
- (2) Remove the intercooler outlet hose from the vehicle.

J9319-45

**Fig. 17 Pulley Removal**

- 1 - POWER STEERING PUMP DRIVE PULLEY  
2 - SPECIAL TOOL C-4333

- (3) Remove the accessory drive belt from the power steering pump pulley. Refer to Cooling System for the procedure.

- (4) Install a allen wrench in the power steering pump center shaft to hold the pump in position. Remove the (3) power steering pump pulley retaining bolts (Fig. 18).

80bc4e8b

**Fig. 18 Installing Power Steering Pump Pulley**

- 1 - POWER STEERING PUMP  
2 - ALLEN WRENCH HOLDING PUMP CENTER SHAFT  
3 - POWER STEERING PUMP PULLEY

- (5) Remove the power steering pulley.

## PULLEY (Continued)

### INSTALLATION

#### INSTALLATION

**NOTE:** The pulley is marked front for installation.

**CAUTION:** On vehicles equipped with the 4.0L or 4.7L, Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

- (1) Replace pulley if bent, cracked, or loose.
- (2) Install pulley on pump with Installer C-4063-B or equivalent installer (Fig. 19). The front edge of the pulley hub must be flush with the end of the shaft. Ensure the tool and pulley are aligned with the pump shaft.

**Fig. 19 Pulley Installation**

- 1 - POWER STEERING PUMP DRIVE PULLEY
- 2 - SPECIAL TOOL C-4063-B

- (3) Install pump assembly.
- (4) With Serpentine Belt, run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

#### INSTALLATION - 2.7L DIESEL

- (1) Install the power steering pump pulley on the pump. Torque the retaining bolts to 27 N·m (20 ft. lbs.). Use the allen wrench to hold the pump from rotating.
- (2) Install the accessory drive belt on the power steering pump pulley. Refer to Cooling System for the procedure.
- (3) Install the intercooler outlet hose on the vehicle.
- (4) Connect the negative battery cable.

## RESERVOIR

### REMOVAL

#### REMOVAL

- (1) Remove power steering pump.
- (2) Clean exterior of pump.
- (3) Clamp the pump body in a soft jaw vice.

**NOTE:** Use new retaining clips for installation.

- (4) Pry up tab and slide the retaining clips off (Fig. 20).

**Fig. 20 Pump Reservoir Clips**

- 1 - RESERVOIR
- 2 - RETAINING CLIPS

- (5) Remove fluid reservoir from pump body. Remove and discard O-ring seal.

#### REMOVAL - 2.7L DIESEL

- (1) Siphon and drain the fluid from the pump.
- (2) Remove the intercooler outlet hose from the vehicle.
- (3) Remove the front fascia. Refer to the body section.
- (4) Remove the cooler hose to the reservoir.
- (5) Remove the return hose at the reservoir from the pump.
- (6) Remove the supply hose at the reservoir from the fan.

## RESERVOIR (Continued)

## INSTALLATION

## INSTALLATION

(1) Lubricate new O-ring Seal with Mopar Power Steering Fluid or equivalent.

(2) Install O-ring seal in housing.

(3) Install reservoir onto housing.

(4) Slide and tap in **new** reservoir retainer clips until tab locks to housing.

(5) Install power steering pump.

(6) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(2) Install the return hose at the reservoir from the pump.

(3) Install the cooler hose to the reservoir.

(4) Install the front fascia. Refer to the body section.

(5) Install the intercooler outlet hose to the vehicle.

(6) Fill the reservoir and check the power steering system for leaks.

## INSTALLATION - 2.7L DIESEL

(1) Install the supply hose at the reservoir from the fan.

# AUTOMATIC TRANSMISSION - 42RE

## DESCRIPTION

The 42RE is a four speed fully automatic transmission (Fig. 1) with an electronic governor. The 42RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

| 14 - FRONT BEARING                               | 28 - REAR PLANETARY GEAR          |

### IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan gasket surface (Fig. 2). Refer to this information when ordering replacement parts.

80b11960

**Fig. 2 Transmission Part And Serial Number Location**

2 - BUILD DATE  
3 - SERIAL NUMBER

### GEAR RATIOS

The 42RE gear ratios are:

<b>1st</b>	2.74:1
<b>2nd</b>	1.54:1
<b>3rd</b>	1.00:1
<b>4th</b>	0.69:1
<b>Rev.</b>	2.21:1

### OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**PARK POWERFLOW**

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

**Fig. 3 Park Powerflow**

- 1 - PAWL ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

80c070a6

**NEUTRAL POWERFLOW**

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

- 5 - PAWL

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**REVERSE POWERFLOW**

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from

the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**FIRST GEAR POWERFLOW**

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to

the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**SECOND GEAR POWERFLOW**

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed.

Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**DIRECT DRIVE POWERFLOW**

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary

set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**FOURTH GEAR POWERFLOW**

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

**DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION**

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

**DIAGNOSIS AND TESTING - PRELIMINARY**

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

**VEHICLE IS DRIVEABLE**

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.
- (6) Perform air-pressure test to check clutch-band operation.

**VEHICLE IS DISABLED**

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift or throttle linkage.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
  - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
  - (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.
  - (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

**DIAGNOSIS AND TESTING - ROAD TESTING**

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

## CLUTCH AND BAND APPLICATION CHART

SHIFT LEVER POSITION	TRANSMISSION CLUTCHES AND BANDS					OVERDRIVE CLUTCHES		
	FRONT CLUTCH	FRONT BAND	REAR CLUTCH	REAR BAND	OVER- RUNNING CLUTCH	OVER- DRIVE CLUTCH	DIRECT CLUTCH	OVER- RUNNING CLUTCH
Reverse	X			X			X	
Drive - First			X		X		X	X
Drive - Second		X	X				X	X
Drive - Third	X		X				X	X
Drive - Fourth	X		X			X		
Manual Second		X	X				X	X
Manual First			X	X	X		X	X

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrunning braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

## DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

### Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

**Fig. 9 Pressure Test Port Locations**

- 1 - OVERDRIVE CLUTCH TEST PORT
- 2 - GOVERNOR TEST PORT
- 3 - ACCUMULATOR TEST PORT
- 4 - FRONT SERVO TEST PORT
- 5 - REAR SERVO TEST PORT

#### Test One - Transmission In Manual Low

**NOTE:** This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

- (1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.
- (2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.
- (3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.
- (4) Have helper start and run engine at 1000 rpm.
- (5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

#### Test Two - Transmission In 2 Range

**NOTE:** This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

- (1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.
- (2) Have helper start and run engine at 1000 rpm.
- (3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.
- (4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.
- (5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

#### Test Three - Transmission In D Range Third Gear

**NOTE:** This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

- (1) Turn OD switch off.
- (2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.
- (3) Move Gauge C-3293-SP over to front servo port for this test.
- (4) Have helper start and run engine at 1600 rpm for this test.
- (5) Move transmission shift lever two detents rearward from full forward position. This is D range.
- (6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:
  - Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
  - Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

## Test Four - Transmission In Reverse

**NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.**

- (1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.
- (2) Move 300 psi Gauge C-3293-SP back to rear servo port.
- (3) Have helper start and run engine at 1600 rpm for test.
- (4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.
- (5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.
- (6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

## Test Five - Governor Pressure

**NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.**

- (1) Move 100 psi Test Gauge C-3292 to governor pressure port.
- (2) Move transmission shift lever two detents rearward from full forward position. This is D range.
- (3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.
- (4) Note governor pressure:
  - Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

## Test Six - Transmission In Overdrive Fourth Gear

**NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.**

- (1) Remove tachometer; it is not needed for this test.
- (2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.
- (3) Lower vehicle.
- (4) Turn OD switch on.
- (5) Secure test gauge so it can be viewed from drivers seat.
- (6) Start engine and shift into D range.
- (7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.
- (8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.
- (9) Return to shop or move vehicle off chassis dyno.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

## PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

## DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

**Fig. 10 Air Pressure Test Passages**

- 1 - REAR SERVO APPLY
- 2 - FRONT SERVO APPLY
- 3 - PUMP SUCTION
- 4 - FRONT CLUTCH APPLY
- 5 - FRONT SERVO RELEASE
- 6 - LINE PRESSURE TO ACCUMULATOR
- 7 - PUMP PRESSURE
- 8 - TO CONVERTER
- 9 - REAR CLUTCH APPLY
- 10 - FROM CONVERTER
- 11 - TO COOLER

### Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

### Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK**

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

**Fig. 11 Converter Housing Leak Paths**

- 1 - PUMP SEAL
- 2 - PUMP VENT
- 3 - PUMP BOLT
- 4 - PUMP GASKET
- 5 - CONVERTER HOUSING
- 6 - CONVERTER
- 7 - REAR MAIN SEAL LEAK

**TORQUE CONVERTER LEAK POINTS**

Possible sources of converter leaks are:

- Leaks at the weld joint around the outside diameter weld.
- Leaks at the converter hub weld.

**CONVERTER HOUSING AREA LEAK CORRECTION**

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.
- (4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.
- (5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.
- (6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.
- (7) Adjust front band.
- (8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.
- (9) Install transmission and converter housing dust shield.
- (10) Lower vehicle.

**DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS**

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

## DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Add Fluid
	2. Throttle Linkage Mis-adjusted.	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose.	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken.	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect.	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect.	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Mis-adjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter.
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Mis-adjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump).	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Mis-adjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB® scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Replace cooler.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Mis-adjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB® scan tool and repair as required.
	8. Front Band Mis-adjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Mis-adjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Mis-adjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn.	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Circuit Electrical Fault.	1. Test with DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Mis-adjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB® scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB® scan tool.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Mis-adjusted/Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB® scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Mis-adjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Mis-assembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Mis-assembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking.	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Replace cooler.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage.
	3. Rear Band Mis-adjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage.
	4. Gearshift Linkage Mis-adjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines.	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN MANUAL 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Mis-adjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Mis-adjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB® scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB® scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Mis-adjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB® scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB® scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB® scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB® scan tool and replace if necessary.
	6. Neutral Sense to PCM Wire Shorted/Cut.	6. Test switch/sensor as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Mis-adjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB® scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance.	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Mis-adjusted.	1. Adjust linkage/cable.
	2. Neutral Sense Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Park/Neutral Switch, or Transmission Range Sensor Faulty.	3. Refer to service section for test and replacement procedure.
	4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Mis-adjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose/Leaky/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**STANDARD PROCEDURE - ALUMINUM  
THREAD REPAIR**

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

**REMOVAL**

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

If only the overdrive unit requires service, refer to Overdrive Removal for proper procedures.

**CAUTION:** The transmission and torque converter must be removed as an assembly to avoid component damage. The converter driveplate, pump bushing, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Disconnect fluid cooler lines at transmission.
- (4) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (5) Disconnect and remove crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain sensor attaching bolts.

**CAUTION:** The crankshaft position sensor will be damaged if the transmission is removed, or installed, while the sensor is still bolted to the engine block, or transmission (4.0L only). To avoid damage, be sure to remove the sensor before removing the transmission.

- (6) Remove the bolts holding the bell housing brace to the transmission.
- (7) Remove nut holding the bell housing brace to the engine to transmission bending brace.
- (8) Remove the bell housing brace from the transmission (Fig. 12).
- (9) Remove the bolt holding the torque converter cover to the transmission.
- (10) Remove the torque converter cover from the transmission.
- (11) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

80ba79c3

**Fig. 12 Bell Housing Brace and Converter Cover**

- 1 - Transmission
- 2 - Torque Converter Cover
- 3 - Bellhousing Brace

(12) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal. On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing.

(13) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on damper bolt.

(14) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts.

(15) Disconnect wires from park/neutral position switch and transmission solenoid.

(16) Disconnect gearshift cable from transmission manual valve lever (Fig. 13).

80ba79c4

**Fig. 13 Transmission Shift Cable**

- 1 - SHIFT CABLE
- 2 - MANUAL LEVER
- 3 - MANUAL LEVER

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(17) Disconnect throttle valve cable from transmission bracket and throttle valve lever (Fig. 14).

(18) Disconnect transfer case shift cable from the transfer case shift lever (Fig. 15).

(19) Remove the clip securing the transfer case shift cable into the cable support bracket.

80ba79c5

**Fig. 14 Throttle Valve Cable**

- 1 - THROTTLE VALVE CABLE  
2 - THROTTLE VALVE LEVER  
3 - THROTTLE BODY

80ba79c6

**Fig. 15 Transfer Case Shift Cable**

- 1 - TRANSFER CASE SHIFT LEVER  
2 - TRANSFER CASE SHIFT CABLE

(20) Disconnect transmission fluid cooler lines at transmission fittings and clips.

(21) Support rear of engine with safety stand or jack.

(22) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(23) Remove bolts securing rear support and cushion to transmission and crossmember (Fig. 16).

(24) Remove bolts attaching crossmember to frame and remove crossmember.

80ba79c7

**Fig. 16 Rear Transmission Crossmember**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

(25) Remove transfer case (Fig. 17) and (Fig. 18).

80ba79c9

**Fig. 17 Remove NV247 Transfer Case**

- 1 - NV247 TRANSFER CASE

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 18 Remove NV242 Transfer Case**

1 - NV242 TRANSFER CASE

(26) Remove bolts holding the upper transmission bending braces to the torque converter housing and the overdrive unit (Fig. 19).

(27) Remove all remaining converter housing bolts.

**Fig. 19 Remove Upper Transmission Bending Braces**

1 - TRANSMISSION BENDING BRACES

(28) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(29) Hold torque converter in place during transmission removal.

(30) Lower transmission and remove assembly from under the vehicle.

(31) To remove torque converter, carefully slide torque converter out of the transmission.

**DISASSEMBLY**

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure input shaft end play as follows (Fig. 20).

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move the input shaft in and out. Record the maximum travel for assembly reference.

**Fig. 20 Checking Input Shaft End Play**

1 - TOOL 8266-8

2 - TOOL 8266-6

3 - TOOL C-3339

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(7) Remove filter from valve body (Fig. 21). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

80c072b6

**Fig. 21 Oil Filter Removal**

- 1 - OIL FILTER
- 2 - VALVE BODY
- 3 - FILTER SCREWS (2)

(8) Remove park/neutral position switch.  
 (9) Remove hex head bolts attaching valve body to transmission case (Fig. 22). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

80c072b7

**Fig. 22 Valve Body Bolt Locations**

- 1 - VALVE BODY BOLTS
- 2 - VALVE BODY BOLTS

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 23).

(11) Remove accumulator piston and inner and outer springs (Fig. 24).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

80c072b8

**Fig. 23 Valve Body Removal**

- 1 - GOVERNOR PRESSURE SENSOR
- 2 - VALVE BODY
- 3 - PARK ROD
- 4 - ACCUMULATOR PISTON
- 5 - GOVERNOR PRESSURE SOLENOID

J9121-208

**Fig. 24 Accumulator Piston And Springs**

- 1 - ACCUMULATOR PISTON
- 2 - OUTER SPRING
- 3 - INNER SPRING

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 25).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 25).

**Fig. 25 Removing Oil Pump And Reaction Shaft Support Assembly**

1 - OIL PUMP AND REACTION SHAFT SUPPORT ASSEMBLY  
2 - SLIDE HAMMER TOOLS C-3752

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 26).

**Fig. 26 Removing Front Band Strut**

1 - BAND LEVER  
2 - BAND STRUT  
3 - FRONT BAND

(19) Remove front band lever (Fig. 27).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

**Fig. 27 Removing Front Band Lever**

1 - FRONT BAND LEVER

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 28).

**Fig. 28 Removing Front/Rear Clutch Assemblies**

1 - INPUT SHAFT  
2 - FRONT CLUTCH  
3 - REAR CLUTCH

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(23) Lift front clutch off rear clutch (Fig. 29). Set clutch units aside for overhaul.

J9121-125

**Fig. 29 Separating Front/Rear Clutch Assemblies**

- 1 - FRONT CLUTCH  
2 - REAR CLUTCH

(24) Remove intermediate shaft thrust washer from front end of shaft or from rear clutch hub (Fig. 30).

J9121-214

**Fig. 30 Removing Intermediate Shaft Thrust Washer**

- 1 - INTERMEDIATE SHAFT THRUST WASHER  
2 - INPUT SHAFT  
3 - REAR CLUTCH RETAINER HUB

(25) Remove output shaft thrust plate from intermediate shaft hub (Fig. 31).

(26) Slide front band off driving shell (Fig. 32) and remove band from case.

J9121-215

**Fig. 31 Removing Intermediate Shaft Thrust Plate**

2 - INTERMEDIATE SHAFT THRUST PLATE

J9121-127

**Fig. 32 Front Band Removal**

- 1 - DRIVING SHELL  
2 - FRONT BAND

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(27) Remove planetary geartrain as assembly (Fig. 33). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap-ring (Fig. 34).

J9121-217

**Fig. 33 Removing Planetary Geartrain And Intermediate Shaft Assembly**

1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

J9121-351

**Fig. 34 Removing Low-Reverse Drum Snap-Ring**

1 - LOW-REVERSE DRUM  
2 - HUB OF OVERDRIVE PISTON RETAINER  
3 - LOW-REVERSE DRUM SNAP-RING

(31) Remove low-reverse drum and reverse band.  
(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 35).

J9121-222

**Fig. 35 Overrunning Clutch Assembly Removal**

1 - OVERRUNNING CLUTCH CAM  
2 - REAR BAND REACTION PIN  
3 - OVERRUNNING CLUTCH ASSEMBLY

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 36).

(34) Remove front servo rod guide snap-ring. Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

60be44b7

**Fig. 36 Compressing Front Servo Rod Guide**

- 1 - SPRING COMPRESSOR TOOL C-3422-B  
2 - ROD GUIDE SNAP-RING

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 37).

(37) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

**NOTE:** To Service the overrunning clutch cam or overdrive piston retainer, refer to the Overrunning Clutch Cam service procedure in this section.

## CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE:** Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assem-

J9121-345

**Fig. 37 Compressing Rear Servo Spring**

- 1 - FRONT SERVO SNAP-RING  
2 - REAR SERVO SNAP-RING  
3 - SPECIAL TOOL

bly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

## ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use Mopar® Door Ease, or Ru-Glyde™ on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 38). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 39).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap-ring (Fig. 40).

J9121-343

Fig. 38 Rear Servo Components

Fig. 39 Front Servo Components

- 1 - PISTON SEAL RINGS
- 2 - SERVO PISTON
- 3 - SNAP-RING
- 4 - ROD GUIDE
- 5 - SPRING
- 6 - ROD

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 41). Be sure twin lugs on band are seated against reaction pin.

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

(b) Guide drum through rear band.

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

80be44b7

**Fig. 40 Compressing Front/Rear Servo Springs**

- 1 - SPRING COMPRESSOR TOOL C-3422-B  
2 - ROD GUIDE SNAP-RING

**Fig. 41 Rear Band Installation**

- 1 - REAR BAND

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 42).

(e) Turn drum back and forth. Drum should rotate freely in clockwise direction and lock in counterclockwise direction (as viewed from front of case).

**Fig. 42 Installing Low-Reverse Drum**

- 1 - REAR BAND  
2 - LOW-REVERSE DRUM

(7) Install snap-ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 43).

**Fig. 43 Installing Low-Reverse Drum Retaining Snap-Ring**

- 1 - LOW-REVERSE DRUM  
2 - HUB OF OVERDRIVE PISTON RETAINER  
3 - LOW-REVERSE DRUM SNAP-RING

**AUTOMATIC TRANSMISSION - 42RE (Continued)**

(8) Install rear band lever and pivot pin (Fig. 44). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 45).

**Fig. 44 Rear Band Lever And Pivot Pin Installation**

- 1 - REAR BAND LEVER
- 2 - LEVER PIVOT PIN

**Fig. 45 Installing Planetary Geartrain**

- 1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(10) Install thrust plate on intermediate shaft hub (Fig. 46). Use petroleum jelly to hold thrust plate in place.

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 47). Also verify that shaft seal rings are installed in sequence shown.

**Fig. 46 Installing Intermediate Shaft Thrust Plate**

- 1 - INTERMEDIATE SHAFT HUB
- 2 - INTERMEDIATE SHAFT THRUST PLATE

**Fig. 47 Input Shaft Seal Ring Location**

- 1 - INPUT SHAFT
- 2 - TEFLON SEAL RING
- 3 - PLASTIC SEAL RING
- 4 - REAR CLUTCH RETAINER

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(12) Install rear clutch thrust washer (Fig. 48). Use additional petroleum jelly to hold washer in place if necessary.

**Fig. 48 Installing Rear Clutch Thrust Washer**

- 1 - REAR CLUTCH RETAINER  
2 - REAR CLUTCH THRUST WASHER (FIBER)

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 49). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 50). Use enough petroleum jelly to hold washer in place. Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub. Note thickness of this washer. It is a select fit part and is used to control transmission end play.

**Fig. 49 Assembling Front And Rear Clutch Units**

- 1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED  
2 - REAR CLUTCH ASSEMBLY

**Fig. 50 Installing Intermediate Shaft Thrust Washer**

- 1 - INTERMEDIATE SHAFT THRUST WASHER  
2 - INPUT SHAFT  
3 - REAR CLUTCH RETAINER HUB

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 51). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

**Fig. 51 Aligning Rear Clutch Disc Lugs**

- 1 - REAR CLUTCH DISCS  
2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(18) Install front and rear clutch units as assembly (Fig. 52). Align rear clutch with front annulus gear and install assembly in driving shell. Be sure output shaft thrust washer and thrust plate are not displaced during installation.

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

J9121-124

**Fig. 52 Installing Front/Rear Clutch Assemblies**

- 1 - INPUT SHAFT
- 2 - FRONT CLUTCH
- 3 - REAR CLUTCH

(20) Assemble front band strut.  
 (21) Install front band adjuster, strut and adjusting screw (Fig. 53).

(22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

(23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that the thrust washer is properly positioned (Fig. 54). Use petroleum jelly to hold thrust washer in place if necessary.

J9121-197

**Fig. 53 Front Band Linkage Installation**

- 1 - BAND LEVER
- 2 - BAND STRUT
- 3 - FRONT BAND

(24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

J9121-194

**Fig. 54 Reaction Shaft Support Seal Rings And Thrust Washer**

- 1 - REACTION SHAFT SUPPORT HUB
- 2 - THRUST WASHER
- 3 - SEAL RINGS

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 55).

(26) Align and install oil pump gasket (Fig. 55).

J9121-195

**Fig. 55 Installing Pilot Studs And Oil Pump Gasket**

- 1 - OIL PUMP GASKET  
2 - PILOT STUD TOOLS C-3288-B

(27) Install oil pump (Fig. 56). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

J9121-196

**Fig. 56 Installing Oil Pump**

- 1 - OIL PUMP  
2 - PILOT STUD TOOL  
3 - PILOT STUD TOOL

(29) Measure input shaft end play (Fig. 57).

**NOTE:** If end play is incorrect, transmission is incorrectly assembled, or the intermediate shaft thrust washer is incorrect. The intermediate shaft thrust washer is selective.

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.56-2.31 mm (0.022-0.091 in.). Adjust as necessary.

80c070b5

**Fig. 57 Checking Input Shaft End Play**

- 1 - TOOL 8266-8  
2 - TOOL 8266-6  
3 - TOOL C-3339

## AUTOMATIC TRANSMISSION - 42RE (Continued)

(30) Install accumulator piston and inner and outer springs (Fig. 58).

(31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.

80c072b8

**Fig. 58 Accumulator Piston And Springs**

- 1 - GOVERNOR PRESSURE SENSOR
- 2 - VALVE BODY
- 3 - PARK ROD
- 4 - ACCUMULATOR PISTON
- 5 - GOVERNOR PRESSURE SOLENOID

(32) Install valve body as follows:

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.

**CAUTION:** It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

(35) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 59). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

RH272

**Fig. 59 Installing Manual Lever Shaft Seal**

- 1 - 15/16" SOCKET
- 2 - SEAL

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

## INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal during installation.

(2) Lubricate oil pump seal lip with transmission fluid.

(3) Align converter and oil pump.

(4) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(5) Check converter seating with steel scale and straightedge (Fig. 60). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(6) Temporarily secure converter with C-clamp.

(7) Position transmission on jack and secure it with chains.

(8) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 60 Checking Torque Converter Seating - Typical**

- 1 - SCALE  
2 - STRAIGHTEDGE

(9) Apply a light coating of Mopar® High Temp grease to the torque converter hub pocket in the rear of the crankshaft

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install two bolts to attach converter housing to engine.

(14) Install the upper transmission bending braces to the torque converter housing and the overdrive unit. Tighten the bolts to 41 N·m (30 ft.lbs.).

(15) Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).

(16) Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).

(17) Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).

(18) Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

(19) Remove engine support fixture.

(20) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(21) Install new plastic retainer grommet on any shift cable that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into cable and to snap grommet onto lever.

(22) Connect gearshift and throttle valve cable to transmission.

(23) Connect wires to park/neutral position switch and transmission solenoid connector. Be sure transmission harnesses are properly routed.

**CAUTION:** It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(24) Install all torque converter-to-driveplate bolts by hand.

(25) Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 31 N·m (270 in. lbs.).

(26) Install converter housing access cover. Tighten bolt to 23 N·m (200 in.lbs.).

(27) Install the bell housing brace to the torque converter cover and the engine to transmission bending brace. Tighten the bolts and nut to 41 N·m (30 ft.lbs.).

(28) Install starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION) and cooler line bracket.

(29) Connect cooler lines to transmission.

(30) Install transmission fill tube. Install new seal on tube before installation.

(31) Install exhaust components.

(32) Install transfer case. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).

(33) Install the transfer case shift cable to the cable support bracket and the transfer case shift lever.

(34) Align and connect propeller shaft(s).

(35) Adjust gearshift linkage and throttle valve cable if necessary.

(36) Lower vehicle.

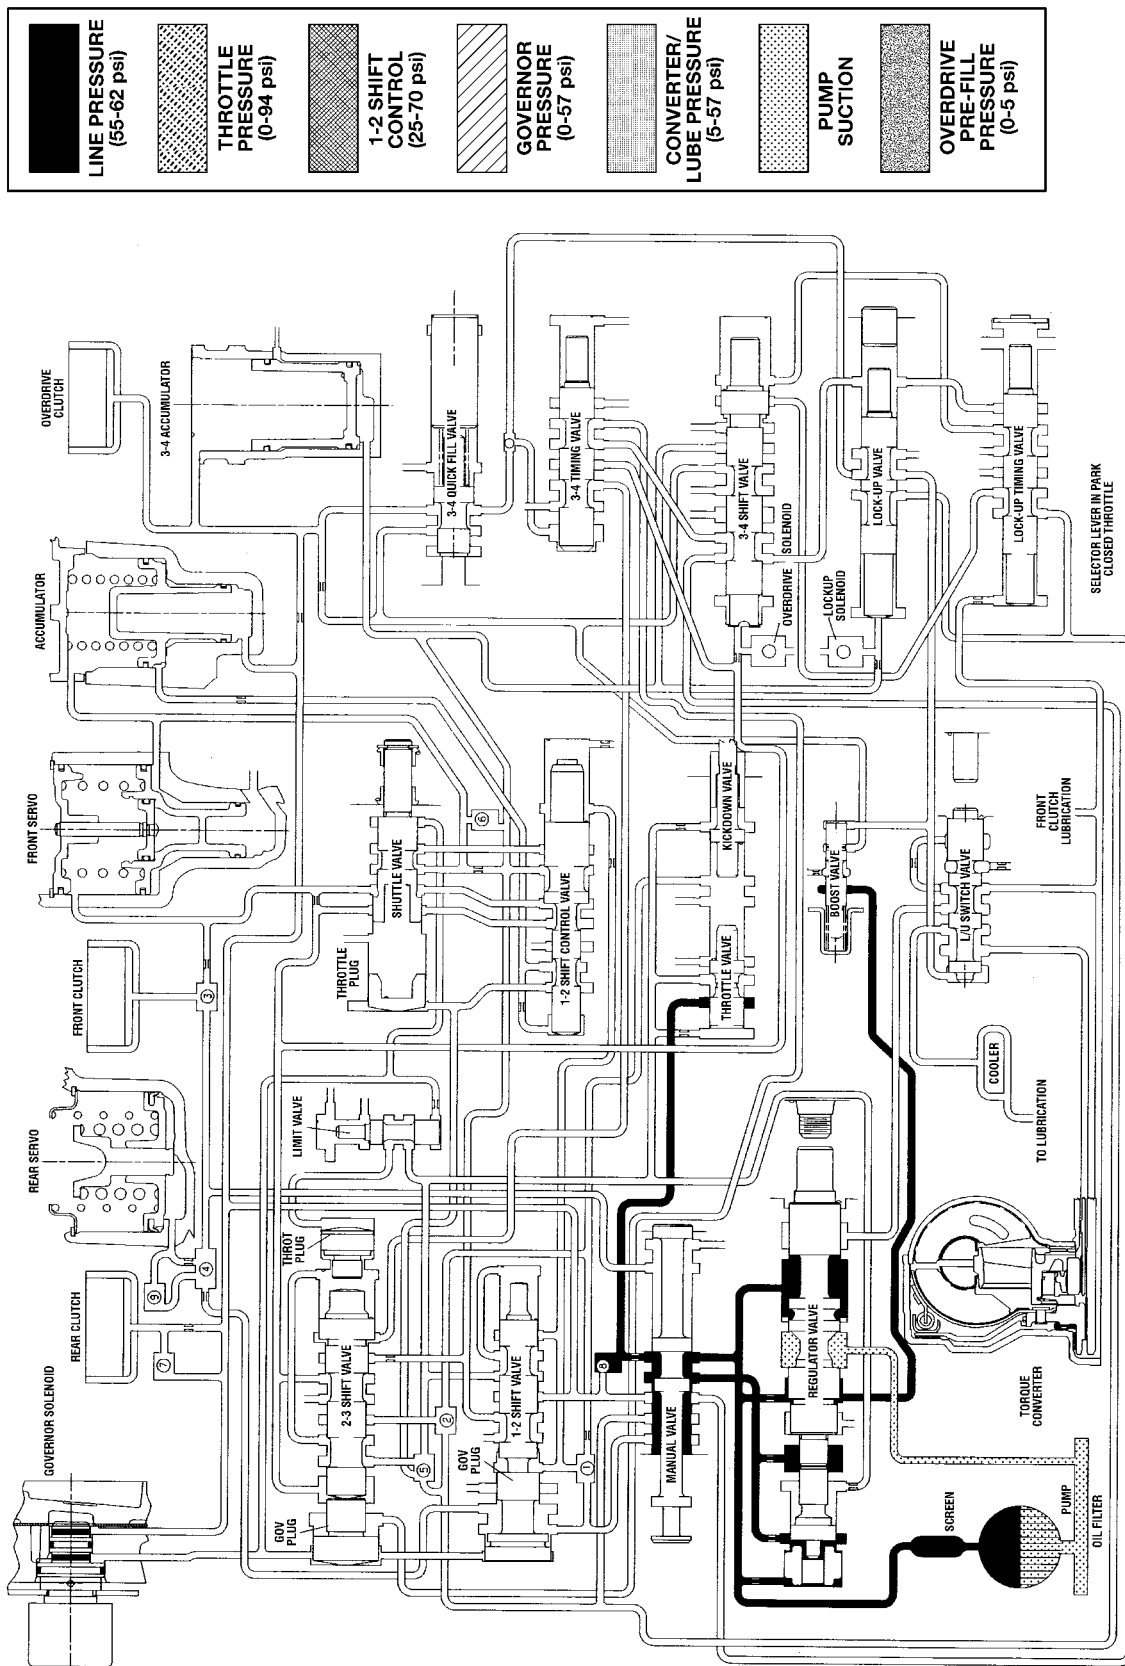

(37) Fill transmission with Mopar® ATF +4, type 9602, fluid.

## SPECIFICATIONS

## TRANSMISSION

## GENERAL

Component	Metric	Inch
Planetary end play	0.127-1.22 mm	0.005-0.048 in.
Input shaft end play	0.56-2.31 mm	0.022-0.091 in.
Clutch pack clearance/ Front.	1.70- 3.40mm	0.067-0.134 in.
Clutch pack clearance/ Rear.	0.559-0.914 mm	0.022-0.036 in.
Front clutch	4 discs	
Rear clutch	4 discs	
Overdrive clutch	3 discs	

Component	Metric	Inch
Direct clutch	6 discs	
42RE Band adjustment from 72 in. lbs.		
Front band	Back off 3 turns	
Rear band	Back off 4 turns	
Recommended fluid	Mopar® ATF +4, Automatic Transmission Fluid	

## GEAR RATIOS

1ST GEAR	2.74:1
2ND GEAR	1.54:1
3RD GEAR	1.0:1
4TH GEAR	0.69:1
REVERSE	2.21:1

## THRUST WASHER/SPACER/SNAP-RING DIMENSIONS

Component	Metric	Inch
Front clutch thrust washer (reaction shaft support hub)	1.55 mm	0.061 in.
Rear clutch thrust washer (clutch retainer)	1.55 mm	0.061 in.
Intermediate shaft thrust plate (shaft hub pilot)	Select fit to set end play	
Output shaft thrust washer (rear clutch hub)	1.5-1.6 mm	0.060-0.063 in.
Rear clutch pack snap-ring	1.5 mm	0.060 in.
	1.95 mm	0.076 in.
	2.45 mm	0.098 in.
Planetary geartrain snap-ring (at front of output shaft)	Select fit (three thicknesses available)	
Overdrive piston thrust plate	Thrust plate and spacer are select fit. Refer to size charts and selection procedures in Overdrive Unit D&A procedures	
Intermediate shaft spacer		

## AUTOMATIC TRANSMISSION - 42RE (Continued)

**PRESSURE TEST**

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third or Fourth gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range R range	No more than 21 kPa (3 psi) lower than line pressure. 1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

**Installer, Bushing - SP-5117****Remover, Bushing - SP-5324****Installer, Bushing - SP-5325****Compressor, Spring - C-3575-A****Gauge - 6312****Adapter, Band Adjuster - C-3705****Installer, Piston - 8114****Remover, Bushing - 6957****Installer, Bushing - 6951****Retainer, Detent Ball and Spring - 6583**

## ACCUMULATOR

### DESCRIPTION

The accumulator (Fig. 61) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 62).

**Fig. 61 Accumulator**

- 1 - ACCUMULATOR PISTON
- 2 - PISTON SPRING

**Fig. 62 3-4 Accumulator and Housing**

- 1 - ACCUMULATOR PISTON
- 2 - 3-4 ACCUMULATOR HOUSING
- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

### OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 63), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 64), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

**NOTE:** The accumulator is shown in the inverted position for illustrative purposes.

### BOTTOMED AGAINST ACCUMULATOR PLATE

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 65). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 65). Replace the springs if the coils are cracked, distorted or collapsed.

## BANDS

## DESCRIPTION

## KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 66) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

80a3b192

**Fig. 66 Front Band**

- 1 - FRONT BAND
- 2 - TRANSMISSION HOUSING

## BANDS (Continued)

## LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 67) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

Fig. 67 Rear Band

- 1 - ADJUSTING SCREW
- 2 - LOCKNUT
- 3 - LEVER
- 4 - REAR BAND
- 5 - REACTION PIN
- 6 - O-RINGS
- 7 - PIVOT PIN

## OPERATION

## KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

## LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

## ADJUSTMENTS

## ADJUSTMENT - BANDS

## FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 68). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx™ socket.

**CAUTION:** If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 3 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

Fig. 68 Front Band Adjustment Screw Location

- 1 - LOCK-NUT
- 2 - FRONT BAND ADJUSTER

## BANDS (Continued)

## REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns (Fig. 69). Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.
- (5) Back off adjusting screw 4 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.
- (7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.
- (8) Lower vehicle and refill transmission with Mopar® ATF +4, Automatic Transmission fluid.

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

## DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It

interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 70).

**Fig. 70 Ignition Interlock Cable**

- 1 - SHIFT MECHANISM  
2 - SHIFTER BTISI LEVER  
3 - ADJUSTMENT CLIP

- 4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

**OPERATION**

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shifter assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any gear position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

**DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK****SYSTEM VERIFICATION**

(1) Verify that the key can only be removed in the PARK position

(2) When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.

(3) Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.

(4) Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.

(6) Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

*DIAGNOSTIC CHART*

CONDITION	POSSIBLE CAUSE	CORRECTION
KEY WILL NOT ROTATE TO THE OFF/LOCK POSITION.	1. Misadjusted Park Lock cable.	1. Adjust Park Lock cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)
	2. Misadjusted gearshift cable.	2. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)
	3. Burrs on ignition key.	3. Remove burrs and cycle key several times to verify operation.
	4. Binding or broken components.	4. Inspect system components and repair/replace components as necessary.
VEHICLE WILL NOT START UNLESS SHIFTER IS HELD FORWARD OF THE PARK POSITION.	1. Misadjusted gearshift cable.	1. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

ADJUSTMENTS - BRAKE TRANSMISSION  
SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

## ADJUSTMENT PROCEDURE

(1) Remove floor console as necessary for access to the brake transmission shift interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift the transmission into the PARK position.

(3) Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

(4) Pull cable lock button up to release cable (Fig. 71).

(5) Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.

(6) Push lock button down until it snaps in place.

## BTSI FUNCTION CHECK

(1) Verify removal of ignition key allowed in PARK position only.

(2) When the shift lever is in PARK, and the shift handle push-button is in the out position, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.

(3) Shifting out of PARK should be possible when the ignition key cylinder is in the off position.

(4) Shifting out of PARK should not be possible while applying normal push-button force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.

(6) Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

80dba6a6

**Fig. 71 Brake Transmission Shift Interlock Cable**

1 - SHIFT MECHANISM  
2 - SHIFTER BTSI LEVER  
3 - ADJUSTMENT CLIP

4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

(7) The floor shifter lever and gate positions should be in alignment with all transmission detent positions.

(8) Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.

(9) With shifter lever handle push-button not depressed and lever detent in:

- PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.

- PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.

- NEUTRAL position- engine start must be possible.

- NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

## ELECTRONIC GOVERNOR

### DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

### GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 72).

### GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 73).

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 73).

J9321-408A

**Fig. 72 Governor Pressure Solenoid Valve**

2 - GOVERNOR PRESSURE SOLENOID

80c072af

**Fig. 73 Governor Pressure Sensor**

- 1 - GOVERNOR BODY  
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

### GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission pressure control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below,  $-1^{\circ}\text{C}$  ( $30^{\circ}\text{F}$ ). A second curve is used when fluid temperature is at, or above,  $10^{\circ}\text{C}$  ( $50^{\circ}\text{F}$ ) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

### OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

## ELECTRONIC GOVERNOR (Continued)

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output values are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the "cold" period of operation.

**GOVERNOR PRESSURE SOLENOID VALVE**

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

**GOVERNOR PRESSURE SENSOR**

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

**GOVERNOR BODY AND TRANSFER PLATE**

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

**GOVERNOR PRESSURE CURVES****LOW TRANSMISSION FLUID TEMPERATURE**

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher

than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

**NORMAL OPERATION**

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade "hunting" prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

**WIDE OPEN THROTTLE OPERATION**

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

**TRANSFER CASE LOW RANGE OPERATION**

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine "flare." The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

## ELECTRONIC GOVERNOR (Continued)

**REMOVAL**

- (1) Hoist and support vehicle on safety stands.
- (2) Remove transmission fluid pan and filter.
- (3) Disengage wire connectors from pressure sensor and solenoid (Fig. 74).

## EXTENSION HOUSING BUSHING

### REMOVAL

- (1) Remove extension housing yoke seal.
- (2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 82).

80a11095

**Fig. 82 Bushing Removal - Typical**

- 1 - REMOVER 6957
- 2 - EXTENSION HOUSING BUSHING

### INSTALLATION

- (1) Align bushing oil hole with oil slot in extension housing.
- (2) Tap bushing into place with Installer 6951 and Handle C-4171.
- (3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 83).

J9521-58

**Fig. 83 Transmission Extension Housing Seal Installation**

- 1 - SPECIAL TOOL C-3995-A OR C-3972-A
- 2 - SPECIAL TOOL C-4471

## EXTENSION HOUSING SEAL

### REMOVAL

- (1) Raise vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Seal Remover C-3985-B (Fig. 84) from overdrive housing.

J9521-57

**Fig. 84 Removing Overdrive Housing Yoke Seal**

- 1 - SPECIAL TOOL C-3985-B
- 2 - SEAL

### INSTALLATION

- (1) Place seal in position on overdrive housing.
- (2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 85).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

J9521-58

**Fig. 85 Installing Transmission Housing Seal**

## FLUID AND FILTER

### DIAGNOSIS AND TESTING

#### DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

#### DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

#### DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure

due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

### STANDARD PROCEDURE

#### STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

#### PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive

## FLUID AND FILTER (Continued)

vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

- (2) Position vehicle on level surface.
- (3) Start and run engine at curb idle speed.
- (4) Apply parking brakes.
- (5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.
- (6) Clean top of filler tube and dipstick to keep dirt from entering tube.
- (7) Remove dipstick (Fig. 86) and check fluid level as follows:

- (a) Correct acceptable level is in crosshatch area.
- (b) Correct maximum level is to MAX arrow mark.
- (c) Incorrect level is at or below MIN line.
- (d) If fluid is low, add only enough Mopar® ATF +4, Automatic Transmission fluid, to restore correct level. Do not overfill.

## PROCEDURE TWO

- (1) Start engine and apply parking brake.
- (2) Shift the transmission into DRIVE for approximately 2 seconds.
- (3) Shift the transmission into REVERSE for approximately 2 seconds.
- (4) Shift the transmission into PARK.
- (5) Hook up DRB® scan tool and select engine.

804d8eee

**Fig. 86 Dipstick Fluid Level Marks - Typical**

- 1 - DIPSTICK
- 2 - MAXIMUM CORRECT FLUID LEVEL
- 3 - ACCEPTABLE FLUID LEVEL

- (6) Select sensors.
- (7) Read the transmission temperature value.
- (8) Compare the fluid temperature value with the figure. (Fig. 87)
- (9) Adjust transmission fluid level shown on the dipstick according to the figure.

**NOTE:** After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

- (10) Check transmission for leaks.

80a3bfba

**Fig. 87 42RE Fluid Fill Graph**

## FLUID AND FILTER (Continued)

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

## REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission (Fig. 88).
- (4) Loosen bolts holding rear of pan to transmission.
- (5) Slowly separate front of pan and gasket away from transmission allowing the fluid to drain into drain pan.
- (6) Hold up pan and remove remaining bolt holding pan to transmission.
- (7) While holding pan level, lower pan and gasket away from transmission.
- (8) Pour remaining fluid in pan into drain pan.
- (9) Remove screws holding filter to valve body (Fig. 89).
- (10) Separate filter from valve body and pour fluid in filter into drain pan.
- (11) Dispose of used trans fluid and filter properly.

Fig. 88 Transmission Pan

- 1 - TRANSMISSION  
2 - GASKET  
3 - PAN

## INSTALLATION

- (1) Position a new transmission oil filter onto the valve body.
- (2) Install the screws to hold the filter to the valve body. Tighten the screws to 4 N·m (35 in.lbs.).
- (3) Clean the gasket surfaces of the transmission oil pan and transmission pan rail.

80b170e8

Fig. 89 Transmission Filter

- 1 - TRANSMISSION  
2 - FILTER

**NOTE:** The transmission pan oil gasket is reusable. Inspect the sealing surfaces of the gasket. If the sealing ribs on both surfaces appear to be in good condition, clean the gasket of any foreign material and reinstall.

- (4) Position the oil pan gasket onto the oil pan.
- (5) Position the oil pan and gasket onto the transmission and install several bolts to hold the pan and gasket to the transmission.
- (6) Install the remainder of the oil pan bolts. Tighten the bolts to 13.6 N·m (125 in.lbs.).
- (7) Lower vehicle and fill transmission. (Refer to 21 - TRANSMISSION/AUTOMATIC/FLUID - STANDARD PROCEDURE)

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

- (1) Remove dipstick and insert clean funnel in transmission fill tube.

- (2) Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, or torque converter was replaced or drained, add **12 pints (6 quarts)** of ATF +4 to transmission.

- (3) Apply parking brakes.
- (4) Start and run engine at normal curb idle speed.
- (5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

## FLUID AND FILTER (Continued)

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

## FRONT CLUTCH

## DESCRIPTION

The front clutch assembly (Fig. 90) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## FRONT CLUTCH (Continued)

## DISASSEMBLY

(1) Remove waved snap-ring and remove pressure plate, clutch plates and clutch discs (Fig. 91).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 92). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

80bdbd40

- 1 - FRONT CLUTCH SPRING
- 2 - COMPRESSOR TOOL C-3575-A
- 3 - RETAINER SNAP-RING
- 4 - SPRING RETAINER

## INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 93). The ball must move freely and not stick.

**NOTE:** Inspect the clutch retainer bushings carefully (Fig. 94). The retainer bushings are **NOT** serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

J9121-368

- 1 - RETAINER CHECK BALL

J9321-223

**Fig. 94 Retainer Bushing Location/Inspection**

- 1 - FRONT CLUTCH RETAINER BUSHINGS (NON-SERVICEABLE)

## ASSEMBLY

**NOTE:** The 42RE transmission uses four plates and discs for the front clutch.

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seals in the clutch retainer lower groove and on outer diameter of the retainer hub. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of the retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate retainer hub, bore and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 95). Use twisting motion to seat piston in bottom of retainer.

## FRONT CLUTCH (Continued)

**CAUTION:** Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.

- (5) Position spring in clutch piston (Fig. 96).
- (6) Position spring retainer on top of piston spring. Make sure retainer is properly installed (Fig. 91).

**Fig. 95 Front Clutch Piston Installation**

- 1 - CLUTCH PISTON
- 2 - FRONT CLUTCH RETAINER

**Fig. 96 Clutch Piston Spring Installation**

- 1 - RETAINER
- 2 - CLUTCH SPRING
- 3 - PISTON

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 92). Then install new snap-ring to secure spring retainer and spring.

(8) Install clutch plates and discs (Fig. 91). Install steel plate then disc until all plates and discs are installed. The front clutch uses 4 clutch discs and plates in a 42RE transmission.

(9) Install pressure plate and waved snap-ring (Fig. 91).

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates, pressure plates and snap-ring may have to be changed.

## FRONT SERVO

## DESCRIPTION

The kickdown servo (Fig. 97) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

**Fig. 97 Front Servo**

- 1 - VENT
- 2 - PISTON ROD
- 3 - PISTON
- 4 - SPRING
- 5 - RELEASE PRESSURE
- 6 - APPLY PRESSURE

## OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend through its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

## FRONT SERVO (Continued)

## DISASSEMBLY

- (1) Remove seal ring from rod guide (Fig. 98).
- (2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.
- (3) Remove and discard servo component o-ring and seal rings.

- 4 - SEAL RING
- 5 - PISTON ROD GUIDE
- 6 - SNAP-RING
- 7 - SERVO SPRING
- 8 - PISTON ROD
- 9 - SERVO PISTON

## CLEANING

Clean the servo piston components (Fig. 99) with solvent and dry them with compressed air.

## INSPECTION

Inspect the servo components (Fig. 100). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

## FRONT SERVO (Continued)

## ASSEMBLY

Clean and inspect front servo components.

- (1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.
- (2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 101).

## GEARSHIFT CABLE

## DIAGNOSIS AND TESTING - GEARSHIFT CABLE

(1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.

(2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.

(3) With floor shift lever handle push-button not depressed and lever in:

(a) PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.

(b) PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position - Normal position. Engine starts must be possible.

(d) NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

## REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Remove the shift cable eyelet from the transmission manual shift lever (Fig. 102).
- (4) Remove shift cable from the cable support bracket.

80ba79c4

Fig. 102 Remove Shift Cable From Transmission

- 1 - SHIFT CABLE
- 2 - MANUAL LEVER
- 3 - MANUAL LEVER

- (5) Lower vehicle.
- (6) Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 103).
- (8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 104).
- (9) Pull cable through floor panel opening.

80dbaaaa

## GEARSHIFT CABLE (Continued)

**Fig. 104 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
- 2 - TRANSMISSION SHIFT CABLE
- 3 - TRANSFER CASE SHIFT CABLE

(10) Remove shift cable from vehicle.

**INSTALLATION**

- (1) Route cable through hole in floor pan.
- (2) Install seal plate to studs in floor pan.
- (3) Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).
- (4) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
- (5) Place the floor shifter lever in PARK position.
- (6) Loosen the adjustment screw on the shift cable.
- (7) Snap the shift cable onto the shift lever pin.
- (8) Raise the vehicle.
- (9) Install the shift cable to the shift cable support bracket.
- (10) Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
- (11) Snap the shift cable onto the transmission manual shift lever.
- (12) Lower vehicle.
- (13) Verify that the shift lever is in the PARK position.
- (14) Tighten the adjustment screw to 7 N·m (65 in.lbs.).
- (15) Verify correct shifter operation.
- (16) Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

**ADJUSTMENTS - GEARSHIFT CABLE**

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position switch or TRS may be faulty.

- (1) Shift transmission into PARK.
- (2) Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (3) Loosen the shift cable adjustment screw (Fig. 105).

**Fig. 105 Shift Cable at the Shifter**

- 1 - SHIFT LEVER PIN
- 2 - ADJUSTMENT SCREW
- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

- (4) Raise vehicle.
- (5) Unsnap cable eyelet from transmission shift lever (Fig. 106).
- (6) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
- (7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
- (8) Snap cable eyelet onto transmission shift lever.
- (9) Lower vehicle
- (10) Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
- (11) Verify correct operation.

## GEARSHIFT CABLE (Continued)

(12) Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## OIL PUMP

### DESCRIPTION

The oil pump (Fig. 107) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear (Fig. 108), a housing, and a cover that also serves as the reaction shaft support.

### OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

80a483e7

**Fig. 107 Oil Pump and Reaction Shaft Support**

- 2 - PUMP

J9321-214

**Fig. 108 Pump Gear Removal**

- 1 - REACTION SHAFT SUPPORT
- 2 - INNER GEAR
- 3 - OUTER GEAR

### DISASSEMBLY

(1) Remove seal ring from housing and reaction shaft support (Fig. 109).

(2) Mark pump housing and support assembly for alignment reference.

J9321-211

**Fig. 109 Removing Pump Seal Ring**

- 1 - PUMP HOUSING SEAL RING

## OIL PUMP (Continued)

(3) Remove bolts attaching pump body to support (Fig. 110).

**Fig. 110 Pump Support Bolts**

- 1 - REACTION SHAFT SUPPORT  
2 - PUMP

(4) Separate support from pump housing (Fig. 111).

(5) Remove inner and outer gears from reaction shaft support (Fig. 112).

(6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

(7) Remove front clutch thrust washer from support hub (Fig. 113).

**Fig. 111 Separating Pump Housing From Reaction Shaft Support**

- 1 - REACTION SHAFT SUPPORT  
2 - PUMP HOUSING

## OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 114).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 114). Bushing should be flush with pump housing bore.

**Fig. 112 Pump Gear Removal**

**Fig. 113 Support Hub Thrust Washer**

- 1 - BUSHING  
2 - REACTION SHAFT SUPPORT  
3 - THRUST WASHER  
4 - HUB

(3) Stake new pump bushing in two places with blunt punch (Fig. 115). Remove burrs from stake points with knife blade afterward.

## REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 116). Do not clamp any part of reaction shaft or support in vise.

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 116).

(6) Slide new bushing onto Installer Tool SP-5325.

## OIL PUMP (Continued)

**Fig. 114 Removing Oil Pump Bushing**

- 5 - REACTION SHAFT
- 6 - SPECIAL TOOL SP-5324
- 7 - BUSHING

**CLEANING**

Clean pump and support components with solvent and dry them with compressed air.

**INSPECTION**

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

## OIL PUMP (Continued)

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

**ASSEMBLY**

- (1) Lubricate gear bore in pump housing with transmission fluid.
- (2) Lubricate pump gears with transmission fluid.
- (3) Support pump housing on wood blocks (Fig. 117).
- (4) Install outer gear in pump housing (Fig. 117). Gear can be installed either way (it is not a one-way fit).
- (5) Install pump inner gear (Fig. 118).

**CAUTION:** The pump inner gear is a one way fit. The bore on one side of the gear inside diameter (I.D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).

J9321-219

**Fig. 117 Supporting Pump And Installing Outer Gear**

- 1 - OUTER GEAR
- 2 - PUMP HOUSING
- 3 - WOOD BLOCKS

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 119). Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

**CAUTION:** The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

J9321-465

**Fig. 118 Pump Inner Gear Installation**

- 1 - OUTER GEAR
- 2 - INNER GEAR

J9321-218

**Fig. 119 Hub Seal Ring Position**

- 1 - SEAL RINGS
- 2 - SUPPORT HUB

(8) Install reaction shaft support on pump housing (Fig. 120).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

J9321-221

**Fig. 120 Assembling Reaction Shaft Support And Pump Housing**

- 1 - PUMP HOUSING
- 2 - REACTION SHAFT SUPPORT

## OIL PUMP (Continued)

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

(a) Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.

(b) Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.

(c) Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).

(d) Remove pump assembly from transmission case.

(12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 121). Be sure seal lip faces inward.

(13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.

(14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

**Fig. 121 Pump Oil Seal Installation**

- 1 - PUMP BODY
- 2 - PUMP SEAL
- 3 - SPECIAL TOOL C-4193

## OUTPUT SHAFT FRONT BEARING

## REMOVAL

- (1) Remove overdrive unit from the vehicle.
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 122).
- (4) Pull bearing from output shaft.

## INSTALLATION

- (1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.
- (2) Push bearing onto shaft until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing onto output shaft.
- (4) Install overdrive geartrain into housing.

**Fig. 122 Output Shaft Front Bearing**

- 1 - OUTPUT SHAFT FRONT BEARING
- 2 - SNAP-RING
- 3 - OUTPUT SHAFT
- 4 - GROOVE TO REAR
- 5 - OVERDRIVE GEARTRAIN

- (5) Install overdrive unit in vehicle.

## OUTPUT SHAFT REAR BEARING

## REMOVAL

- (1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/AUTOMATIC/OVERDRIVE - REMOVAL)
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 123).
- (4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

**Fig. 123 Output Shaft Rear Bearing**

- 1 - OUTPUT SHAFT REAR BEARING
- 2 - OVERDRIVE HOUSING
- 3 - SNAP-RING

## OUTPUT SHAFT REAR BEARING (Continued)

## INSTALLATION

- (1) Place replacement bearing in position in housing.
- (2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing into housing (Fig. 123).
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

## OVERDRIVE CLUTCH

## DESCRIPTION

The overdrive clutch (Fig. 124) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

**NOTE:** The number of discs and plates may vary with each engine and vehicle combination.

## OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

J9321-369

Fig. 124 Overdrive Clutch

1 - REACTION PLATE

2 - PRESSURE PLATE

## OVERDRIVE OFF SWITCH

### DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

### OPERATION

At key-on, fourth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow upshifts to fourth gear. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the powertrain control module.

### DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

## OVERDRIVE UNIT

### REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Remove transfer case, if equipped.
- (4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if necessary.
- (5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
- (7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diag-

nosis indicated overdrive problems only, remove just the overdrive unit.

(8) Support transmission with transmission jack.

(9) Remove bolts attaching overdrive unit to transmission (Fig. 125).

**CAUTION:** Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

**Fig. 125 Overdrive Unit Bolts**

- 1 - OVERDRIVE UNIT  
2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

## OVERDRIVE UNIT (Continued)

## DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 126).

(2) Remove overdrive piston thrust bearing (Fig. 127).

**Fig. 126 Transmission Speed Sensor Removal**

- 1 - SOCKET AND WRENCH
- 2 - SPEED SENSOR
- 3 - O-RING

**Fig. 127 Overdrive Piston Thrust Bearing Removal**

- 1 - THRUST BEARING
- 2 - OVERDRIVE PISTON
- 3 - THRUST PLATE

## OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 128). Retain thrust plate. It is a select fit part and may possibly be reused.

**Fig. 128 Overdrive Piston Thrust Plate Removal**

- 1 - OVERDRIVE PISTON
- 2 - OVERDRIVE PISTON SPACER (SELECT FIT)

(2) Remove intermediate shaft spacer (Fig. 129). Retain spacer. It is a select fit part and may possibly be reused.

**Fig. 129 Intermediate Shaft Spacer Location**

- 1 - INTERMEDIATE SHAFT
- 2 - INTERMEDIATE SHAFT SPACER (SELECT FIT)

## OVERDRIVE UNIT (Continued)

(3) Remove overdrive piston from retainer (Fig. 130).

**Fig. 130 Overdrive Piston Removal**

- 1 - PISTON RETAINER
- 2 - OVERDRIVE PISTON

## OVERDRIVE CLUTCH PACK

(1) Remove overdrive clutch pack wire retaining ring (Fig. 131).

(2) Remove overdrive clutch pack (Fig. 132).

**NOTE:** The 42RE transmission has three clutch discs and two clutch plates.

(3) Note position of clutch pack components for assembly reference (Fig. 133).

**Fig. 131 Removing Overdrive Clutch Pack Retaining Ring**

- 1 - OVERDRIVE CLUTCH PACK RETAINING RING

## OVERDRIVE GEARTRAIN

(1) Remove overdrive clutch wave spring (Fig. 134).

**Fig. 132 Overdrive Clutch Pack Removal**

- 1 - OVERDRIVE CLUTCH PACK

**Fig. 133 42RE Overdrive Clutch Component Position**

- 1 - PRESSURE PLATE (TO FRONT)
- 2 - OVERDRIVE CLUTCH PACK
- 3 - CLUTCH DISC (3)
- 4 - CLUTCH PLATE (2)
- 5 - REACTION PLATE (TO REAR)

**Fig. 134 Overdrive Clutch Wave**

- 1 - WAVE SPRING

## OVERDRIVE UNIT (Continued)

(2) Remove overdrive clutch reaction snap-ring (Fig. 135). Note that snap-ring is located in same groove as wave spring.

**Fig. 135 Overdrive Clutch Reaction Snap-Ring Removal**

- 1 - REACTION RING  
2 - CLUTCH HUB

(3) Remove Torx™ head screws that attach access cover and gasket to overdrive case (Fig. 136).

(4) Remove access cover and gasket (Fig. 137).

**Fig. 136 Access Cover Screw Removal**

- 1 - TORX SCREWDRIVER (T25)  
2 - ACCESS COVER SCREWS

**Fig. 137 Access Cover And Gasket Removal**

- 1 - ACCESS COVER AND GASKET

(5) Expand output shaft bearing snap-ring with expanding-type snap-ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 138).

**Fig. 138 Releasing Bearing From Locating Ring**

- 1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS  
2 - ACCESS HOLE

(6) Lift gear case up and off geartrain assembly (Fig. 139).

**Fig. 139 Removing Gear Case From Geartrain Assembly**

- 1 - GEARTRAIN ASSEMBLY  
2 - GEAR CASE

## OVERDRIVE UNIT (Continued)

(7) Remove snap-ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 140).

**Fig. 140 Rear Bearing Removal**

- 1 - OUTPUT SHAFT
- 2 - REAR BEARING
- 3 - SNAP-RING

## DIRECT CLUTCH, HUB AND SPRING

**WARNING:** THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(1) Mount geartrain assembly in shop press (Fig. 141).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 141). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 141).

**Fig. 141 Geartrain Mounted In Shop Press**

- 1 - PRESS RAM
- 2 - SPECIAL TOOL C-3995-A (OR SIMILAR TOOL)
- 3 - CLUTCH HUB
- 4 - PLATES
- 5 - PRESS BED
- 6 - SPECIAL TOOL 6227-1

## OVERDRIVE UNIT (Continued)

- (4) Remove direct clutch pack snap-ring (Fig. 142).  
 (5) Remove direct clutch hub retaining ring (Fig. 143).

**Fig. 142 Direct Clutch Pack Snap-Ring Removal**

- 1 - CLUTCH HUB  
 2 - SPECIAL TOOL 6227-1  
 3 - DIRECT CLUTCH PACK SNAP-RING  
 4 - PRESS PLATES  
 5 - CLUTCH DRUM

- (6) Release press load slowly and completely (Fig. 144).

- (7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 144).

**Fig. 144 Direct Clutch Pack Removal**

- 1 - SPECIAL TOOL 6227-1  
 2 - DIRECT CLUTCH HUB  
 3 - DIRECT CLUTCH PACK

## GEARTRAIN

- (1) Remove direct clutch hub and spring (Fig. 145).  
 (2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 146).

**Fig. 143 Direct Clutch Hub Retaining Ring Removal**

- 1 - SPECIAL TOOL 6227-1  
 2 - CLUTCH HUB RETAINING RING  
 3 - PRESS BED  
 4 - PRESS PLATES

**Fig. 145 Direct Clutch Hub And Spring Removal**

## OVERDRIVE UNIT (Continued)

**GEAR CASE AND PARK LOCK**

- (1) Remove locating ring from gear case.
- (2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.
- (3) Remove reaction plug snap-ring and remove reaction plug.
- (4) Remove output shaft seal.

**CLEANING**

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

**INSPECTION**

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should be clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

**ASSEMBLY****GEARTRAIN AND DIRECT CLUTCH**

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, Automatic Transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 154). Lubricate bushings with petroleum jelly, or transmission fluid.

**Fig. 154 Output Shaft Pilot Bushing**

- 1 - OUTPUT SHAFT HUB
- 2 - OVERRUNNING CLUTCH HUB BUSHING
- 3 - INTERMEDIATE SHAFT PILOT BUSHING

## OVERDRIVE UNIT (Continued)

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 155).

(4) Align and install clutch drum on annulus gear (Fig. 156). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 156).

J9021-89

**Fig. 155 Annulus Gear Installation**

- 2 - SNAP-RING

## OVERDRIVE UNIT (Continued)

(8) Install overrunning clutch on hub (Fig. 159). Note that clutch only fits one-way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one-way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

J9121-322

**Fig. 159 Assembling Overrunning Clutch And Hub**

- 1 - CLUTCH HUB  
2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 160). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 161). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

J9121-314

**Fig. 160 Overrunning Clutch Installation**

J9121-324

**Fig. 161 Planetary Gear Installation**

- 1 - PLANETARY GEAR  
2 - ANNULUS GEAR

## OVERDRIVE UNIT (Continued)

(13) Install planetary thrust bearing on sun gear (Fig. 162). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one-way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 163). Be sure sun gear and thrust bearing are fully seated before proceeding.

**Fig. 162 Planetary Thrust Bearing Installation**

- 1 - SPRING PLATE
- 2 - PLANETARY THRUST BEARING
- 3 - SUN GEAR

**Fig. 163 Sun Gear Installation**

- 1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 164). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 165). Be sure spring is properly seated on spring plate.

**Fig. 164 Alignment Tool Installation**

- 3 - CLUTCH HUB
- 4 - PRESS PLATES

## OVERDRIVE UNIT (Continued)

**NOTE:** The 42RE transmission has 6 direct clutch discs and 5 clutch plates.

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 166).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 167).

J9121-329

**Fig. 167 Correct Position Of Direct Clutch Reaction Plate**

- 1 - REACTION PLATE COUNTERBORE
- 2 - DIRECT CLUTCH REACTION PLATE (FLUSH WITH END OF HUB)
- 3 - CLUTCH HUB

J9321-368

**Fig. 166 42RE Direct Clutch Pack Components**

1 - REACTION PLATE

2 - PRESSURE PLATE

## OVERDRIVE UNIT (Continued)

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 168).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 169). Be sure hub is started on sun gear splines before proceeding.

**Fig. 168 Correct Position Of Direct Clutch Pressure Plate**

- 1 - DIRECT CLUTCH PRESSURE PLATE
- 2 - CLUTCH PACK
- 3 - BE SURE SHOULDER SIDE OF PLATE FACES UPWARD

**Fig. 169 Direct Clutch**

- 1 - CLUTCH HUB
- 2 - DIRECT CLUTCH PACK
- 3 - CLUTCH DRUM

**WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 170). Be very sure snap-ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 171). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

**Fig. 170 Direct Clutch Pack Snap-Ring Installation**

8921-240

**Fig. 173 Reaction Plug And Snap-Ring Installation**

- 1 - REACTION PLUG SNAP-RING  
2 - SNAP-RING PLIERS

**GEAR CASE**

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 172). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 173). Compress snap ring only enough for installation; do not distort it.

J9121-338

**Fig. 172 Reaction Plug Locating Pin And Snap-Ring**

**Fig. 177 Locating Ring Access Cover And Gasket Installation**

- 1 - TORX SCREWDRIVER (T25)  
2 - ACCESS COVER SCREWS

## OVERDRIVE CLUTCH

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 178).

(2) Install wave spring on top of reaction ring (Fig. 179). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

**NOTE:** The 42RE transmission has 3 overdrive clutch discs and 2 plates.

J9321-356

**Fig. 178 Overdrive Clutch Reaction Ring Installation**

## OVERDRIVE UNIT (Continued)

J9321-369

**Fig. 180 42RE Overdrive Clutch Components**

1 - REACTION PLATE

2 - PRESSURE PLATE

- (3) Assemble overdrive clutch pack (Fig. 180).
- (4) Install overdrive clutch reaction plate first.

**NOTE:** The reaction plate is thinner than the pressure plate in a 42RE transmission.

- (5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.
- (6) Install clutch pack pressure plate.
- (7) Install clutch pack wire-type retaining ring (Fig. 181).

**INTERMEDIATE SHAFT SPACER SELECTION**

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 182). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of

J9321-352

**Fig. 181 Overdrive Clutch Pack Retaining Ring Installation**

1 - OVERDRIVE CLUTCH PACK RETAINING RING

Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 182).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 183).

(e) Remove Gauge Alignment Tool 6312.

**OD THRUST PLATE SELECTION**

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size

**Fig. 183 Intermediate Shaft End Play Spacer Selection**

mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 184).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 185).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140

1.8850 - 1.8999	.243 - .245

J9121-342

**Fig. 185 Overdrive Piston Thrust Plate Selection****OVERDRIVE PISTON**

(1) Install new seals on over drive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

## OVERDRIVE UNIT (Continued)

- (e) Verify that the locating lugs entered the lug bores in the retainer.
- (6) Install intermediate shaft spacer on intermediate shaft.
- (7) Install overdrive piston thrust plate on overdrive piston.
- (8) Install overdrive piston thrust bearing on overdrive piston.
- (9) Install transmission speed sensor and O-ring seal in overdrive case (Fig. 126).

## INSTALLATION

- (1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.
- (2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.
- (3) Cut out old case gasket around piston retainer with razor knife (Fig. 186).
- (4) Use old gasket as template and trim new gasket to fit.
- (5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

**Fig. 186 Trimming Overdrive Case Gasket**

- 1 - GASKET
- 2 - SHARP KNIFE

- (6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 187).

**Fig. 187 Intermediate Shaft Selective Spacer Location**

- 1 - SELECTIVE SPACER
- 2 - SPACER GROOVE
- 3 - INTERMEDIATE SHAFT

- (7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

**CAUTION:** Be sure the shoulder on the inside diameter of the bearing is facing forward.

- (8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

- (9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

- (10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

- (11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

- (12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

- (13) Connect the transmission speed sensor and overdrive wiring connectors.

- (14) Install the transfer case, if equipped.

- (15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

## OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

### DESCRIPTION

The overrunning clutch (Fig. 188) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

80be45f8

**Fig. 188 Overrunning Clutch**

- 1 - OUTER RACE (CAM)
- 2 - ROLLER
- 3 - SPRING
- 4 - SPRING RETAINER
- 5 - INNER RACE (HUB)

### OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

### DISASSEMBLY

**NOTE:** To service the overrunning clutch cam and the overdrive piston retainer, the transmission geartrain and the overdrive unit must be removed from the transmission.

- (1) Remove the overdrive piston (Fig. 189).
- (2) Remove the overdrive piston retainer bolts.
- (3) Remove overdrive piston retainer.
- (4) Remove case gasket.
- (5) Mark the position of the overrunning clutch cam in the case (Fig. 190).
- (6) Remove the overrunning clutch cam bolts.
- (7) Remove the overrunning clutch cam.

**Fig. 189 Overdrive Piston Removal**

- 2 - OVERRUNNING CLUTCH ASSEMBLY

### CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

## OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

## ASSEMBLY

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 191). This hole must align with blank area in clutch cam bolt circle (Fig. 192). Mark hole location on clutch cam and blank area in case with grease pencil, paint stripe, or scribe mark for assembly reference.

(2) Mark location of non-threaded hole in clutch cam and blank area in bolt circle with grease pencil.

(3) Align and install overrunning clutch and cam in case (Fig. 193). Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. Be sure this side of cam faces rearward (toward piston retainer).

**Fig. 191 Location Of Non-Threaded Hole In Clutch Cam**

- 1 - NON-THREADED HOLE  
2 - OVERRUNNING CLUTCH CAM

**Fig. 192 Location Of Blank Area In Clutch Cam Bolt Circle**

- 1 - OVERRUNNING CLUTCH CAM SEAT IN CASE  
2 - NON-THREADED HOLE IN CLUTCH CAM ALIGNS HERE (BLANK AREA) OF SEAT

**Fig. 193 Overrunning Clutch Installation**

- 1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE  
2 - OVERRUNNING CLUTCH ASSEMBLY

(4) Verify that non-threaded hole in clutch cam is properly aligned. Check alignment by threading a bolt into each bolt hole. Adjust clutch cam position if necessary.

(5) Install and tighten overrunning clutch cam bolts to 17 N·m (13 ft. lbs.) torque. Note that clutch cam bolts are shorter than piston retainer bolts.

## OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

(6) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 194). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(7) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 195). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

**Fig. 194 Installing/Aligning Case Gasket**

- 1 - CASE GASKET
- 2 - BE SURE GOVERNOR TUBE FEED HOLES IN CASE AND GASKET ARE ALIGNED

(8) Install new seals on over drive piston.  
(9) Stand transmission case upright on bellhousing.

(10) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(11) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(12) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

J9321-464

**Fig. 195 Aligning Overdrive Piston Retainer**

- 1 - PISTON RETAINER
- 2 - GASKET
- 3 - RETAINER BOLTS

(e) Verify that the locating lugs entered the lug bores in the retainer.

**NOTE:** Install the remaining transmission components and the overdrive unit.

## PARK LOCK CABLE

### REMOVAL

- (1) Place the shifter in the PARK position.
- (2) Lower the steering column cover.
- (3) With the ignition switch in the "RUN" position depress the park lock cable locking tab, located on top of the cable connector at the steering column and pull the park lock cable straight out.
- (4) Remove the park lock cable from steering column (Fig. 196).
- (5) Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (6) Disconnect the park lock cable from the shift BTSI lever and remove the cable from the shifter assembly bracket.
- (7) Release the park lock cable from any remaining clips.
- (8) Remove park lock cable from the vehicle.

## PARK LOCK CABLE (Continued)

80dba6a6

**Fig. 196 Brake Transmission Shift Interlock**

1 - SHIFT MECHANISM  
2 - SHIFTER BTSI LEVER  
3 - ADJUSTMENT CLIP

4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

**INSTALLATION**

**NOTE:** The gearshift cable must be secured into position and properly adjusted before the installation of the Park Lock Cable.

- (1) Verify that the shifter is in the PARK position.
- (2) Push the park lock cable straight into the square mounting hole in the steering column until cable snaps in place.
- (3) Route park lock cable to the shifter mechanism.
- (4) Install the park lock cable end fitting into shifter BTSI lever.
- (5) Pull rearward on the cable housing to snap park lock cable adjuster ears into floor shifter bracket.
- (6) Place the ignition key cylinder in the ACCESSORY position.
- (7) Push the cable adjuster lock clamp downward to lock it.
- (8) Test the park lock cable operation.
- (9) Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

**PARK/NEUTRAL POSITION SWITCH****DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH**

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

**SWITCH TEST**

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

## PARK/NEUTRAL POSITION SWITCH (Continued)

## REMOVAL

- (1) Raise vehicle and position drain pan under switch.
- (2) Disconnect switch wires.
- (3) Remove switch from case.

## INSTALLATION

- (1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 197).

**Fig. 197 Park/Neutral Position Switch**

- 1 - NEUTRAL CONTACT
- 2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
- 3 - PARK CONTACT
- 4 - SWITCH

- (2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.
- (3) Test continuity of new switch with 12V test lamp.
- (4) Connect switch wires and lower vehicle.
- (5) Top off transmission fluid level.

## OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

## PRESSURE

Pressure (Fig. 198) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

80bfe272

**Fig. 198 Force and Pressure Relationship**

## PISTONS

## DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

## PISTONS (Continued)

### PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 199) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

Fig. 199 Pressure on a Confined Fluid

80bfe273

### FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 200), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 200), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design

and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

Fig. 200 Force Multiplication

80bfe274

### PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 201) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

Fig. 201 Piston Travel

80bfe275

## PLANETARY GEARTRAIN/ OUTPUT SHAFT

### DESCRIPTION

The planetary gearsets (Fig. 202) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

80be45f9

**Fig. 202 Planetary Gearset**

- 1 - ANNULUS GEAR
- 2 - SUN GEAR
- 3 - PLANET CARRIER
- 4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

**NOTE:** The number of pinion gears does not affect the gear ratio, only the duty rating.

### OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.

- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

**NOTE:** Gear ratios are dependent on the number of teeth on the annulus and sun gears.

### DISASSEMBLY

- (1) Remove planetary snap-ring (Fig. 203).
- (2) Remove front annulus and planetary assembly from driving shell (Fig. 203).
- (3) Remove snap-ring that retains front planetary gear in annulus gear (Fig. 204).

J9421-175

- 4 - FRONT THRUST WASHER
- 5 - FRONT PLANETARY

## INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Inspect the geartrain spacers, thrust plates, snap-rings, and thrust washers. Replace any of these parts that are worn, distorted or damaged. Do not attempt to reuse these parts.

The planetary gear thrust washers are different sizes. The large diameter washers go on the front planetary and the smaller washers go on the rear planetary. All the washers have four locating tabs on

them. These tabs fit in the holes or slots provided in each planetary gear.

Inspect the output shaft carefully. Pay particular attention to the machined bushing/bearing surfaces on the shaft and the governor valve shaft bore at the shaft rear.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location (especially at the governor valve shaft bore).

The annulus gears can be removed from their supports if necessary. Just remove the snap-rings and separate the two parts when replacement is necessary. In addition, the annulus gear bushings can be replaced if severely worn, or scored. However it is not necessary to replace the bushings if they only exhibit normal wear. Check bushing fit on the output shaft to be sure.

## ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap-ring is seated and that shoulder-side of support faces rearward (Fig. 207).

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

## PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(4) Install rear annulus over and onto rear planetary gear (Fig. 207).

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 208). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 209). Use enough petroleum jelly to hold washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 210).

(8) Install thrust plate on sun gear (Fig. 211). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

## PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(20) Install front annulus snap-ring (Fig. 220). Use snap-ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

(21) Install planetary selective snap-ring with snap-ring pliers (Fig. 221). Be sure ring is fully seated.

(22) Turn planetary geartrain assembly over so driving shell is facing workbench. Then support geartrain on wood block positioned under forward end of output shaft. This allows geartrain components to move forward for accurate end play check.

(23) Check planetary geartrain end play with feeler gauge (Fig. 222). Gauge goes between shoulder on output shaft and end of rear annulus support.

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap-ring (or thrust washers) may have to be replaced. Snap-rings are available in three different thicknesses for adjustment purposes.

## REAR CLUTCH

### DESCRIPTION

The rear clutch assembly (Fig. 223) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

**NOTE:** The number of discs and plates may vary with each engine and vehicle combination.

### OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assem-

80c070a4

| 9 - CLUTCH PACK SNAP-RING (SELECTIVE)  |                                     |

## REAR CLUTCH (Continued)

bly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

- (1) Remove fiber thrust washer from forward side of clutch retainer.
- (2) Remove input shaft front/rear seal rings.
- (3) Remove selective clutch pack snap-ring (Fig. 224).
- (4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap-ring and wave spring (Fig. 224).
- (5) Remove clutch piston with rotating motion.
- (6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 225). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

## CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

## INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the

 3 - SNAP-RING PLIERS

driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

**ASSEMBLY**

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft, if necessary, (Fig. 226) and (Fig. 227).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

J9121-538

 2 - TEFLON FRONT SEAL RING (SQUEEZE RING TOGETHER SLIGHTLY BEFORE INSTALLATION FOR BETTER FIT)

## REAR CLUTCH (Continued)

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer (Fig. 228). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 225).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

**CAUTION:** Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

(9) Install piston spring in retainer and on top of piston (Fig. 229). Concave side of spring faces downward (toward piston).

**Fig. 228 Pressing Input Shaft Into Rear Clutch Retainer**

- 1 - INPUT SHAFT  
2 - REAR CLUTCH RETAINER  
3 - PRESS RAM

(10) Install wave spring in retainer (Fig. 229). Be sure spring is completely seated in retainer groove.

J9121-153

**Fig. 229 Piston Spring/Wave Spring Position**

- 1 - REAR CLUTCH RETAINER  
2 - PISTON SPRING  
3 - WAVE SPRING  
4 - CLUTCH PISTON

(11) Install bottom pressure plate (Fig. 224). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 224).

(13) Install top pressure plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 230).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 230).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.559 - 0.914 mm (0.022 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap-ring thicknesses are:

- 0.107-0.109 in.
- 0.098-0.100 in.
- 0.095-0.097 in.
- 0.083-0.085 in.
- 0.076-0.078 in.
- 0.071-0.073 in.

## REAR CLUTCH (Continued)

- 0.060-0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 231). Use enough petroleum jelly to hold washer in place.

## REAR SERVO

## DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

## OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

## DISASSEMBLY

- (1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 232).
- (2) Remove and discard servo piston seal ring.

**Fig. 232 Rear Servo Components**

- 1 - SNAP-RING

## SHIFT MECHANISM

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

## OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second, third, and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

## REMOVAL

(1) Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift transmission into PARK.

(3) Disconnect the transmission shift cable at shift lever and shifter assembly bracket (Fig. 235).

(4) Disconnect the park lock cable from the shifter BTSI lever and the shifter assembly bracket. (Fig. 236)

## SHIFT MECHANISM (Continued)

(5) Disconnect the transfer case shift cable from the transfer case shift lever pin (Fig. 237), if equipped.

(6) Remove the clip holding the transfer case shift cable to the shifter assembly bracket, if equipped.

(7) Remove the transfer case shift cable from the shifter assembly bracket, if equipped.

(8) Disengage all wiring connectors from the shifter assembly.

(9) Remove all nuts holding the shifter assembly to the floor pan (Fig. 238).

(10) Remove the shifter assembly from the vehicle.

(10) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.

(11) Snap the shift cable onto the shift lever pin.

(12) Verify that the shift lever is in the PARK position.

(13) Tighten the adjustment screw to 7 N·m (65 in.lbs.).

(14) Place the key in the accessory position.

(15) Push downward on the park lock cable adjustment tab to lock the adjustment.

(16) Verify correct shifter, park lock, and BTSI operation.

(17) Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

**Fig. 238 Shifter Assembly**

1 - FLOOR PAN  
2 - SHIFTER ASSEMBLY

## INSTALLATION

(1) Install shifter assembly onto the shifter assembly studs on the floor pan.

(2) Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).

(3) Place the floor shifter lever in PARK position.

(4) Loosen the adjustment screw on the shift cable.

(5) Verify that the park lock cable adjustment tab is pulled upward to the unlocked position.

(6) Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.

(7) Install the transfer case shift cable to the shifter assembly bracket. Install clip to hold cable to the bracket.

(8) Snap the transfer case shift cable, if equipped, onto the transfer case shift lever pin.

(9) Install the park lock cable into the shifter assembly bracket and into the shifter BTSI lever. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)

## SOLENOID

## DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

## SOLENOID (Continued)

- Increase the amount of current applied to the coil or

- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

## OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## SPEED SENSOR

## DESCRIPTION

The speed sensor (Fig. 239) is located in the over-drive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

## OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

## THROTTLE VALVE CABLE

## DESCRIPTION

Transmission throttle valve cable adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slip-page between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 240). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

80ba79c5

**Fig. 240 Throttle Valve Cable**

1 - THROTTLE VALVE CABLE  
2 - THROTTLE VALVE LEVER  
3 - THROTTLE BODY

## THROTTLE VALVE CABLE (Continued)

## ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable (Fig. 241) will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

**Fig. 241 Throttle Valve Cable**

- 1 - THROTTLE VALVE CABLE
- 2 - THROTTLE VALVE LEVER
- 3 - THROTTLE BODY

## ADJUSTMENT VERIFICATION

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body (Fig. 241) is at curb idle position. Then verify that the transmission throttle lever (Fig. 242) is also at idle (fully forward) position.
- (4) Slide cable off attachment stud on throttle body lever.
- (5) Compare position of cable end to attachment stud on throttle body lever:
  - Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 243).
  - If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.
- (6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.
  - If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.
  - If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will

**Fig. 242 Throttle Valve Cable at Transmission**

- 1 - TRANSMISSION SHIFTER CABLE
- 2 - THROTTLE VALVE CABLE
- 3 - TRANSFER CASE SHIFTER CABLE
- 4 - TRANSFER CASE SHIFTER CABLE BRACKET RETAINING BOLT(S)
- 5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
- 6 - ELECTRICAL CONNECTORS
- 7 - TRANSMISSION FLUID LINES

be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

## ADJUSTMENT PROCEDURE

- (1) Turn ignition switch to OFF position.
- (2) Remove air cleaner if necessary.
- (3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**
- (4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.
- (5) Pry the T.V. cable lock (A) into the UP position (Fig. 243). This will unlock the cable and allow for readjustment.
- (6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable. **Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 243).
- (7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position

## THROTTLE VALVE CABLE (Continued)

80bce9fb

**Fig. 243 Throttle Valve Cable at Throttle Linkage**

- 1 - THROTTLE LINKAGE
- 2 - THROTTLE VALVE CABLE LOCKING CLIP
- 3 - THROTTLE VALVE CABLE

(Fig. 243). This will lock the present T.V. cable adjustment.

**NOTE:** Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

## TORQUE CONVERTER

## DESCRIPTION

The torque converter (Fig. 244) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION:** The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

80c07135

- 7 - DRIVE PLATE

## TORQUE CONVERTER (Continued)

**IMPELLER**

The impeller (Fig. 245) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

**IMPELLER VANE

- 5 - ENGINE ROTATION

## TORQUE CONVERTER (Continued)

**TURBINE**

The turbine (Fig. 246) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

## TORQUE CONVERTER (Continued)

## STATOR

The stator assembly (Fig. 247) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 248). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

Fig. 247 Stator Components

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 249) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

80bfe26d

- 7 - FRICTION DISC

## TORQUE CONVERTER (Continued)

## OPERATION

The converter impeller (Fig. 250) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

80bfe276

**Fig. 250 Torque Converter Fluid Operation**

1 - APPLY PRESSURE

2 - THE PISTON MOVES SLIGHTLY FORWARD

3 - RELEASE PRESSURE

4 - THE PISTON MOVES SLIGHTLY REARWARD

## TORQUE CONVERTER (Continued)

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 251). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

**Fig. 251 Stator Operation**

- 1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

## TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

## REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION:** Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.
- (4) Separate the torque converter from the transmission.

## INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate oil pump seal lip with transmission fluid.
- (2) Place torque converter in position on transmission.

**CAUTION:** Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

## TORQUE CONVERTER (Continued)

(6) Check converter seating with a scale and straightedge (Fig. 252). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

**Fig. 252 Checking Torque Converter Seating - Typical**

1 - SCALE  
2 - STRAIGHTEDGE

## TORQUE CONVERTER DRAINBACK VALVE

## DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

## OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

## STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check

ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

**CAUTION:** The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

## TRANSMISSION TEMPERATURE SENSOR

## DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 253). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 2000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

80c072af

**Fig. 253 Governor Pressure Sensor**

1 - GOVERNOR BODY  
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

## TRANSMISSION TEMPERATURE SENSOR (Continued)

## OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

## VALVE BODY

## DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 254), (Fig. 255), (Fig. 256), and (Fig. 257):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

## OPERATION

**NOTE:** Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

## CHECK BALLS

CHECK BALL NUMBER	DESCRIPTION
1	Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug.
2	Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug.
3	Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch.
4	Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo.
5	Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure.
6	Provides a by-pass around the front servo orifice so that the servo can release quickly.
7	Provides a by-pass around the rear clutch orifice so that the clutch can release quickly.
8	Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient.
9	Provides a by-pass around the rear servo orifice so that the servo can release quickly.
10	Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown.

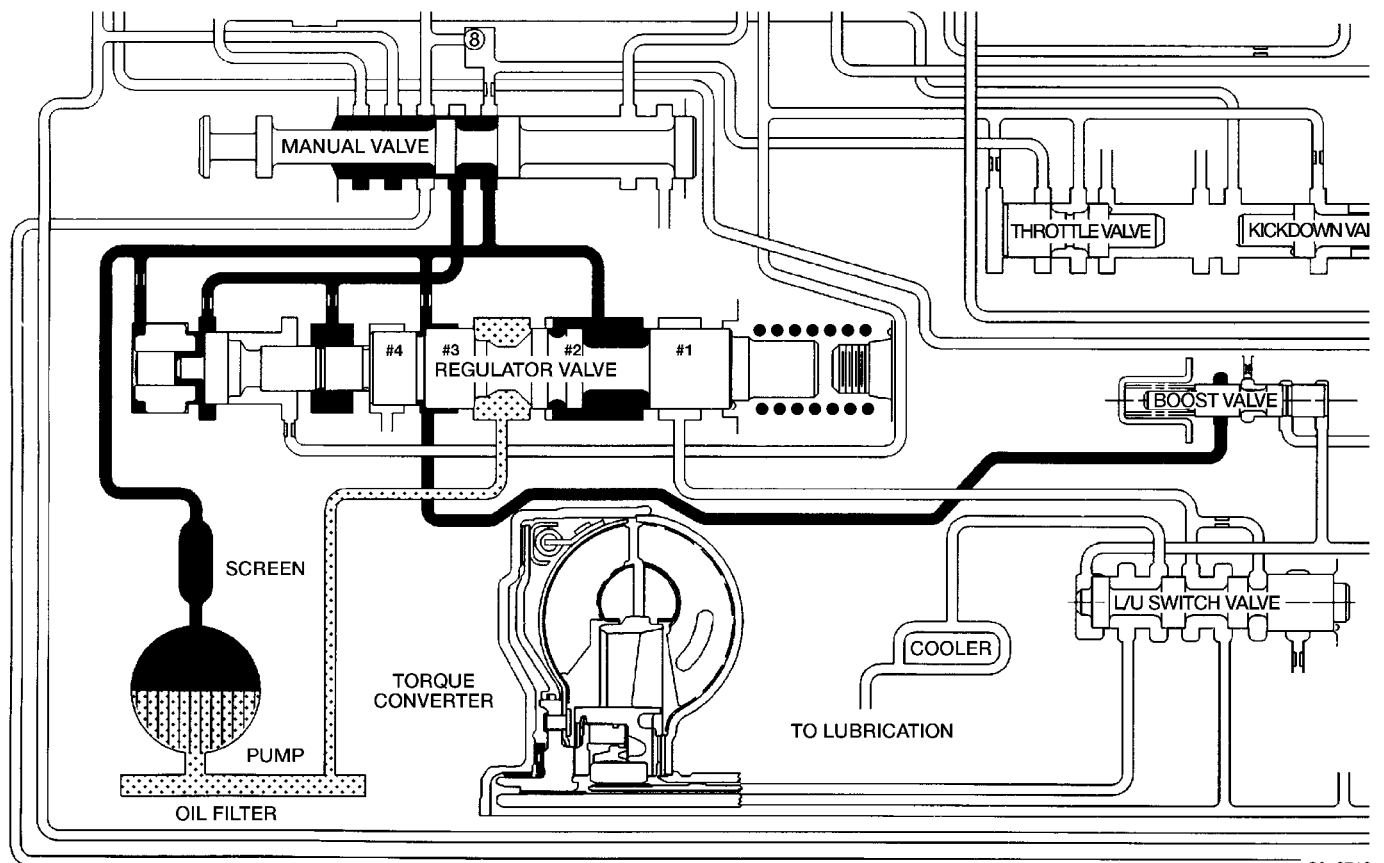

## VALVE BODY (Continued)

## REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 258) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the

dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

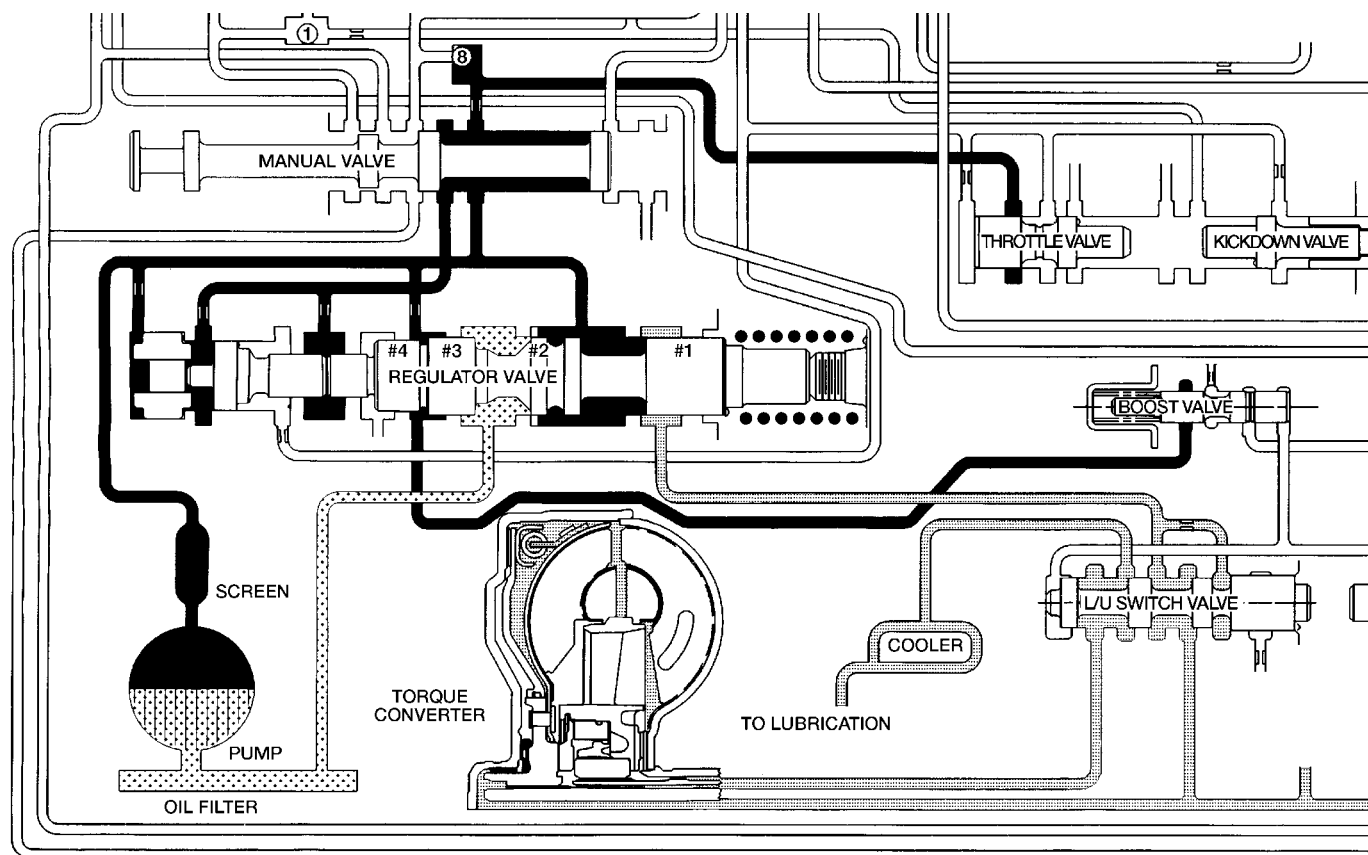

80c0713c

**Fig. 258 Regulator Valve in PARK Position**

## VALVE BODY (Continued)

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 259), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 260). The regulated line pressure in REVERSE (Fig. 261) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

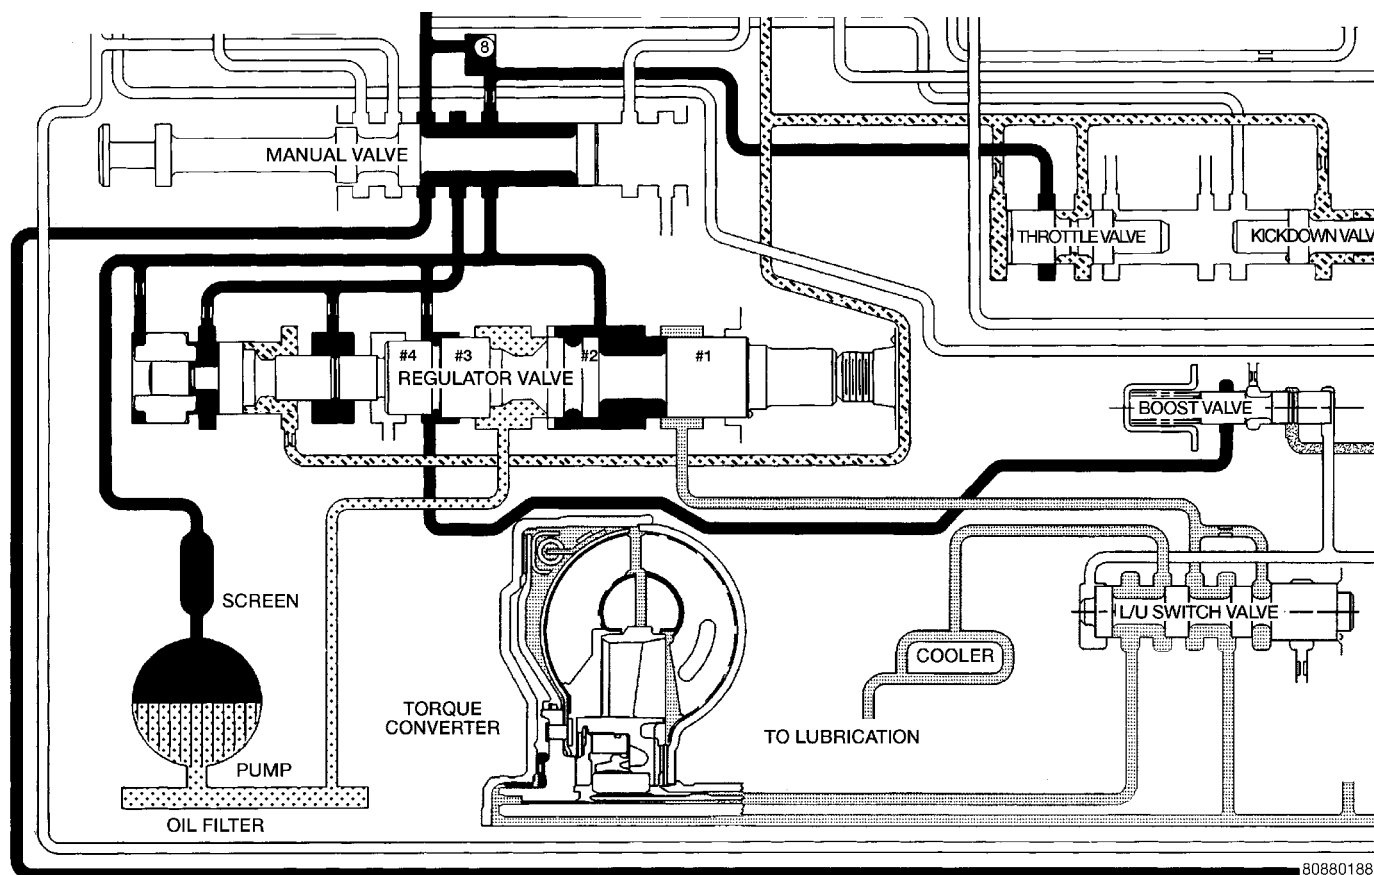

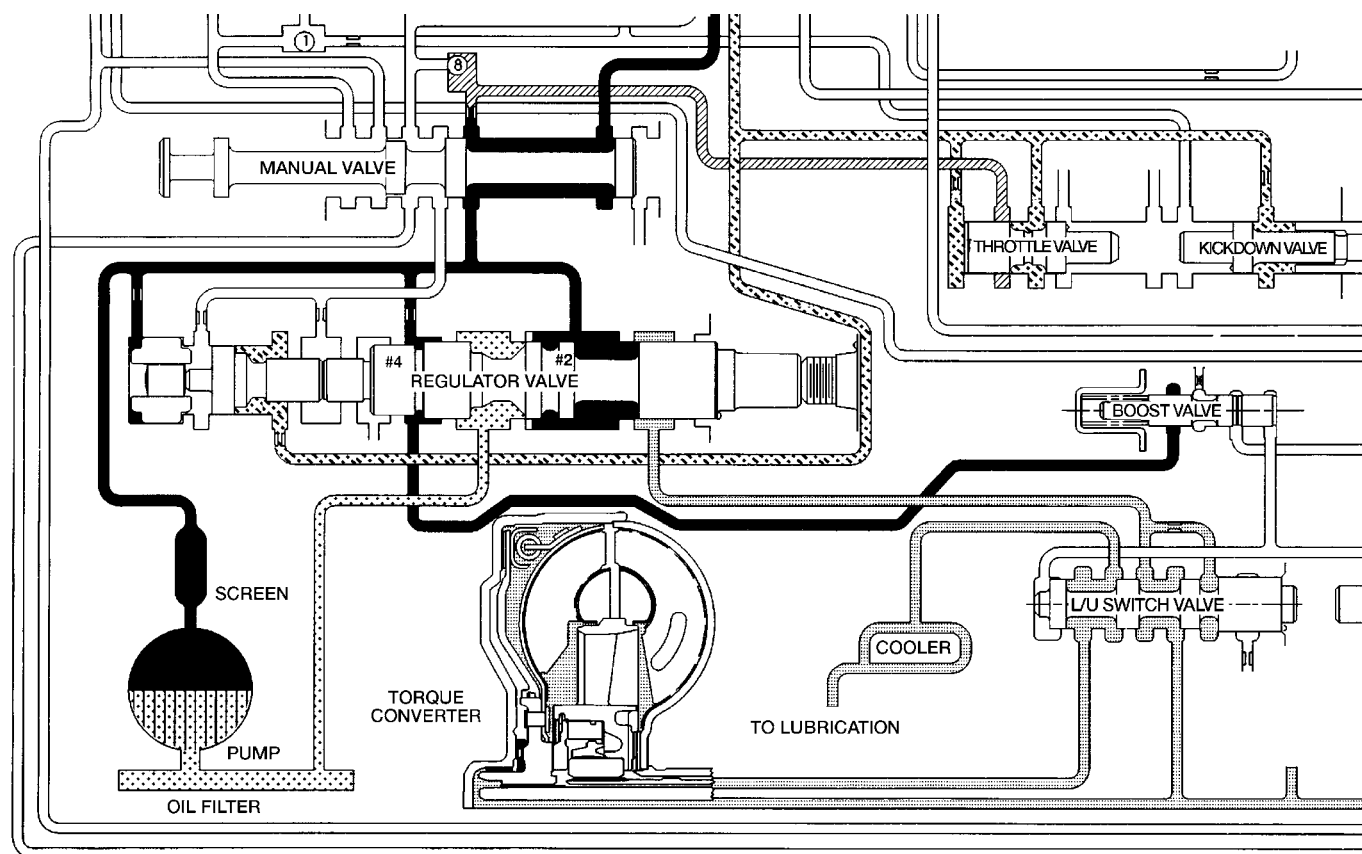

80880187

**Fig. 259 Regulator Valve in NEUTRAL Position**

## VALVE BODY (Continued)

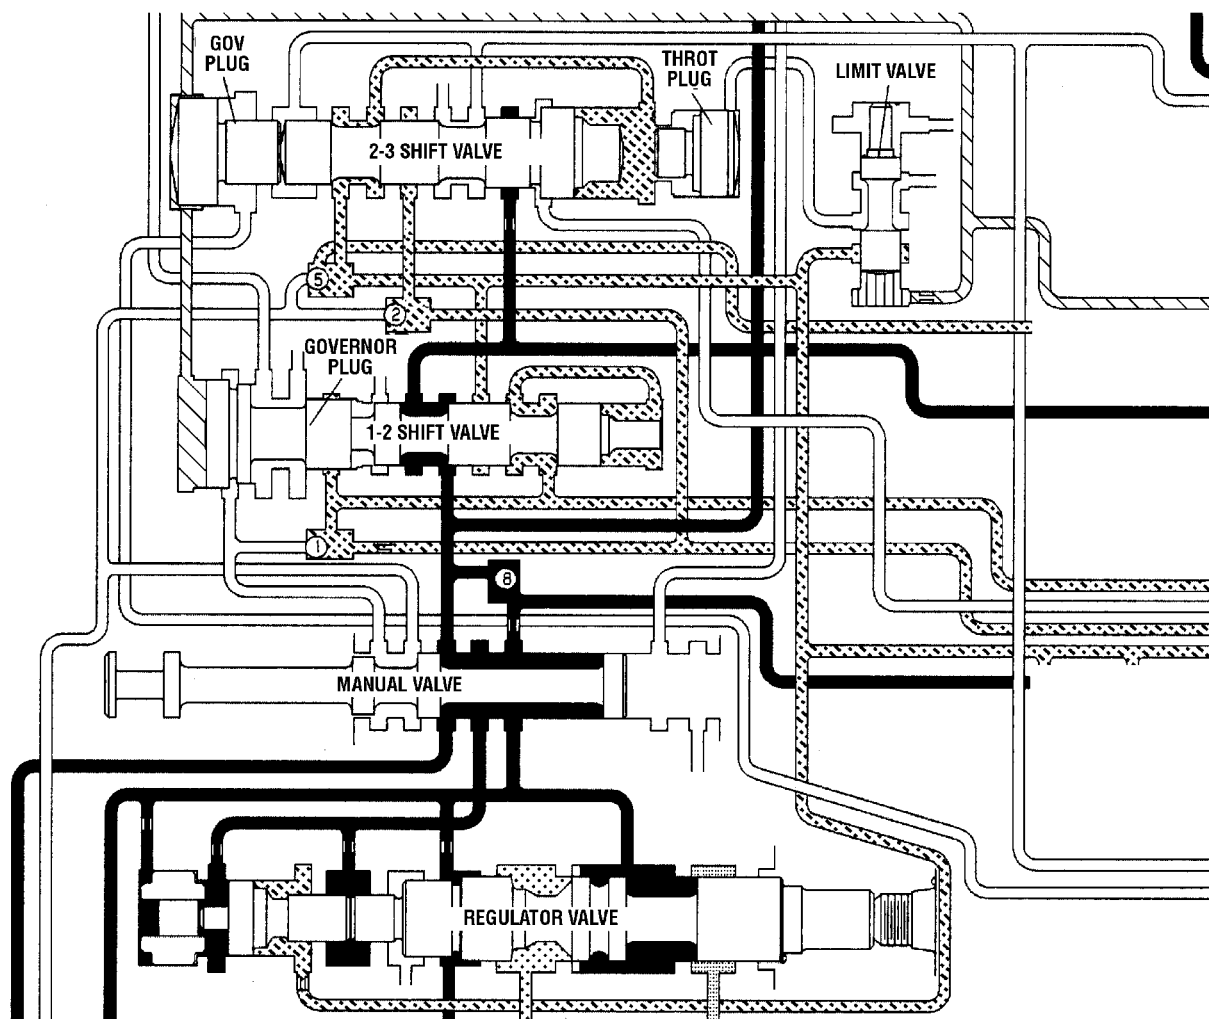

*Fig. 260 Regulator Valve in DRIVE Position**Fig. 261 Regulator Valve in REVERSE Position*

## VALVE BODY (Continued)

**KICKDOWN VALVE**

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 262) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

8088018a

*Fig. 262 Kickdown Valve-Wide Open Throttle*

## VALVE BODY (Continued)

**KICKDOWN LIMIT VALVE**

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 263) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 264), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to

push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

80c07142

**Fig. 263 Kickdown Limit Valve-Low Speeds**

80c07143

**Fig. 264 Kickdown Limit Valve-High Speeds**

## VALVE BODY (Continued)

**1-2 SHIFT VALVE**

The 1-2 shift valve assembly (Fig. 265), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 266).

80c07144

**Fig. 265 1-2 Shift Valve-Before Shift**

80c07145

**Fig. 266 1-2 Shift Valve-After Shift**

## VALVE BODY (Continued)

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

**1-2 SHIFT CONTROL VALVE**

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 267):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kick-down servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

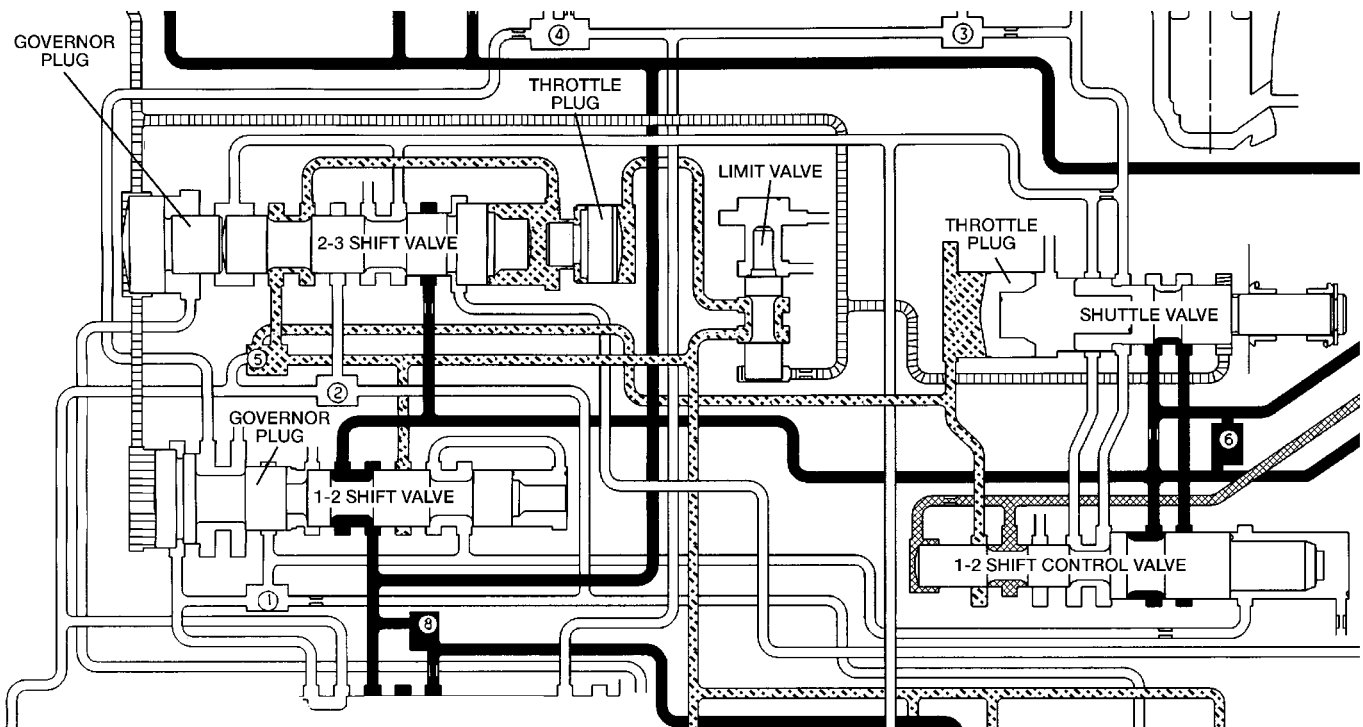

80c07146

**Fig. 267 1-2 Shift Control Valve**

## VALVE BODY (Continued)

**2-3 SHIFT VALVE**

The 2-3 shift valve mechanism (Fig. 268) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

80c07147

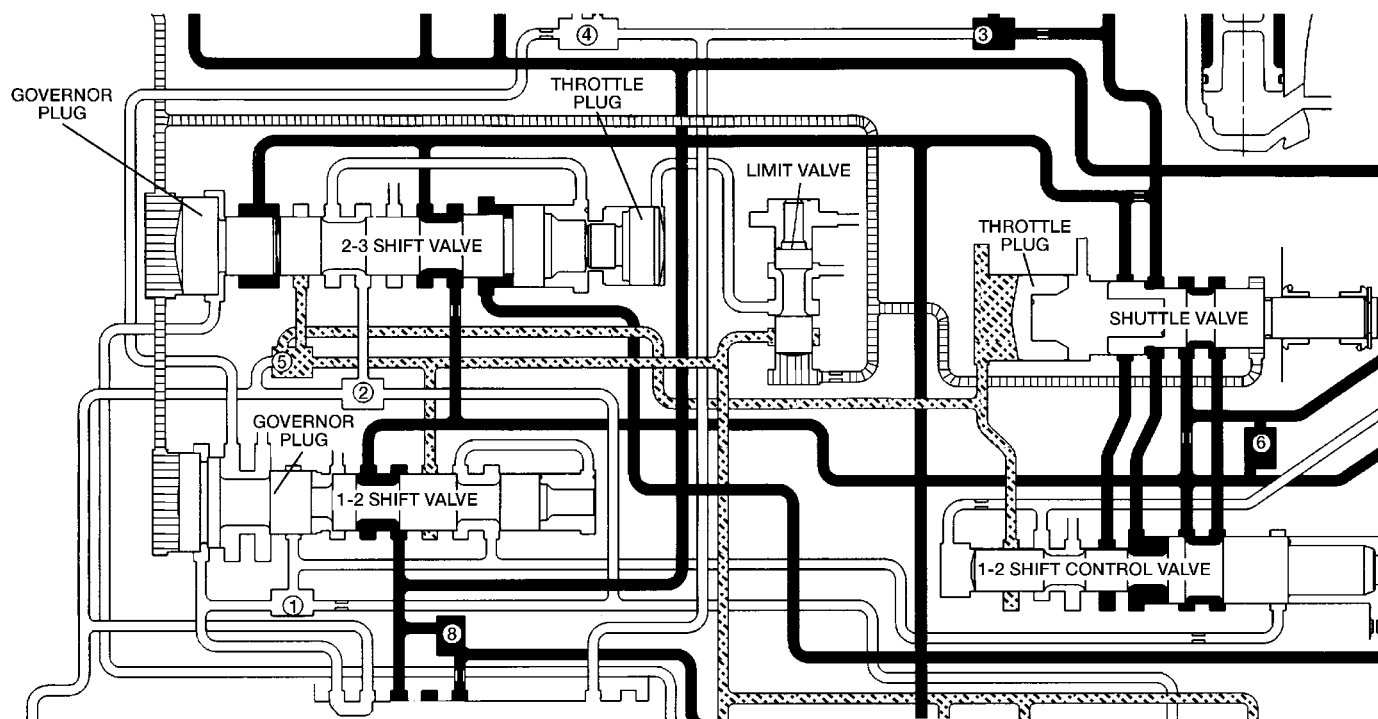

*Fig. 268 2-3 Shift Valve-Before Shift*

## VALVE BODY (Continued)

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 269), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

80c07148

**Fig. 269 2-3 Shift Valve-After Shift**

## VALVE BODY (Continued)

**3-4 SHIFT VALVE**

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 270). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 271). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

**Fig. 270 3-4 Shift Valve Before Shift**

**3-4 TIMING VALVE**

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 271). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 270).

**Fig. 271 3-4 Shift Valve After Shift**

**3-4 QUICK FILL VALVE**

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 270). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a pre-determined pressure develops within the clutch, the valve closes the bypass (Fig. 271). Clutch fill is then completed through the regular feed orifice.

## VALVE BODY (Continued)

## THROTTLE VALVE

In all gear positions the throttle valve (Fig. 272) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve

passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

80c07149

Fig. 272 Throttle Valve

## VALVE BODY (Continued)

## SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 273), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

80880199

Fig. 273 Switch Valve-Torque Converter Unlocked

## VALVE BODY (Continued)

Once the TCC control valve has moved to the right (Fig. 274), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

8088019a

Fig. 274 Switch Valve-Torque Converter Locked

## VALVE BODY (Continued)

## VALVE BODY (Continued)

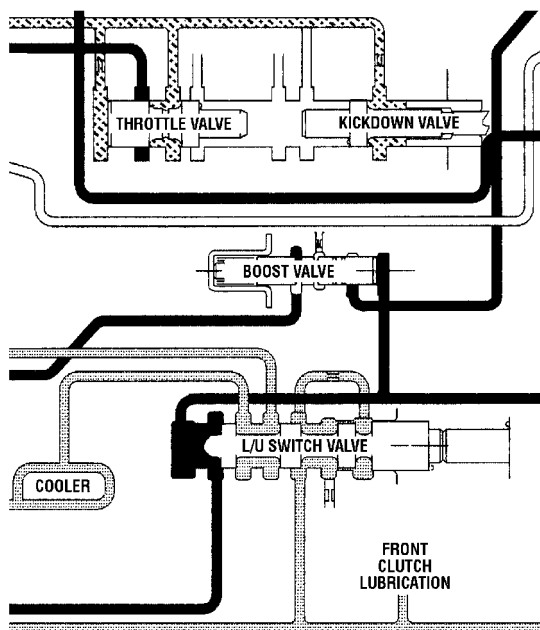

## BOOST VALVE

The boost valve (Fig. 276) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 277), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

8088019c

Fig. 276 Boost Valve Before Lock-up

8088019d

Fig. 277 Boost Valve After Lock-up

## REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
  - Manual lever washer, seal, E-clip, and shaft seal.
  - Manual lever detent ball.
  - Throttle lever.
  - Fluid filter.
  - Pressure adjusting screw bracket.
  - Governor pressure solenoid.
  - Governor pressure sensor (includes transmission temperature thermistor).
  - Converter clutch/overdrive solenoid assembly and harness.
  - Governor housing gasket.
  - Solenoid case connector O-rings.
- (1) Shift transmission into NEUTRAL.
  - (2) Raise vehicle.
  - (3) Remove gearshift and throttle levers from shaft of valve body manual lever.
  - (4) Disconnect wires at solenoid case connector (Fig. 278).

Fig. 278 Transmission Case Connector

- 1 - SOLENOID CASE CONNECTOR
- 2 - PARK/NEUTRAL POSITION SWITCH

## VALVE BODY (Continued)

- (5) Position drain pan under transmission oil pan.
- (6) Remove transmission oil pan and gasket.
- (7) Remove fluid filter from valve body.
- (8) Remove bolts attaching valve body to transmission case.
- (9) Lower valve body enough to remove accumulator piston and springs.
- (10) Work manual lever shaft and electrical connector out of transmission case.
- (11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 279).

80c072b2

**Fig. 279 Valve Body**

- 1 - VALVE BODY
- 2 - WIRE HARNESS

## DISASSEMBLY

**CAUTION:** Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

- (1) Disconnect wires from governor pressure sensor and solenoid.
- (2) Remove screws attaching governor body and retainer plate to transfer plate.

- (3) Remove retainer plate, governor body and gasket from transfer plate.

- (4) Remove governor pressure sensor from governor body.

- (5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

- (6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 280). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

808803a3

## VALVE BODY (Continued)

(12) Secure detent ball and spring with Retainer Tool 6583 (Fig. 286).

(13) Remove park rod E-clip and separate rod from manual lever (Fig. 287).

(14) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 288).

(15) Remove manual lever and throttle lever (Fig. 289). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

## VALVE BODY (Continued)

(16) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 290).

(17) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 291). Hold bracket firmly against spring tension while removing last screw.

(18) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 292). Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.

(19) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 293).

(20) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 293).

(21) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 294).

(22) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 295).

**Fig. 297 Boost Valve Tube Brace**

- 1 - BOOST VALVE TUBE  
2 - TUBE BRACE (DOUBLE TAB)

(25) Remove boost valve connecting tube (Fig. 298). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

**CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.**

(26) Turn valve body over so lower housing is facing upward (Fig. 299). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 299). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 299).

J9321-147

## VALVE BODY (Continued)

## VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 304). Then remove the one large diameter and the six smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 306).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 305).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 306).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 293).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 307).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 307).

(9) Remove 1-2 shift control valve and spring (Fig. 307).

(10) Remove 1-2 shift valve and spring (Fig. 307).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 307).

(12) Remove pressure plug cover (Fig. 307).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 307).

## CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either

part has sustained physical damage (dented, deformed, broken, etc.).

**CAUTION:** Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is **NOT** serviceable. Do not try to remove the filter as this will damage the valve housing.

## INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

**CAUTION:** Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer

## VALVE BODY (Continued)

plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

## ASSEMBLY

**CAUTION:** Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

## LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 308).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

## 3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 309).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

## TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 310).

(2) Install filter screen in upper housing separator plate (Fig. 311).

**Fig. 310 Rear Clutch And Rear Servo Check Ball Locations**

- 1 - REAR CLUTCH CHECK BALL
- 2 - REAR SERVO CHECK BALL
- 3 - TRANSFER PLATE

**Fig. 311 Separator Plate Filter Screen Installation**

- 1 - UPPER HOUSING SEPARATOR PLATE
- 2 - FILTER SCREEN

## VALVE BODY (Continued)

(3) Align and position upper housing separator plate on transfer plate (Fig. 312).

(4) Install brace plate (Fig. 312). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

80a3e115

**Fig. 312 Brace Plate**

- 1 - BRACE
- 2 - TRANSFER PLATE
- 3 - SEPARATOR PLATE

## UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 313). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small

check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 314). Be sure filter screen is seated in proper housing recess.

(3) Install the Number 10 check ball into the transfer plate (Fig. 300). The Number 10 check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 315).

- 2 - TRANSFER PLATE
- 3 - LOWER HOUSING (OVERDRIVE) SEPARATOR PLATE

## VALVE BODY (Continued)

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 316).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 316).

## UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 317), (Fig. 318) and (Fig. 319) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

J9321-442

- 13 - UPPER HOUSING
- 14 - BOOST VALVE COVER

## VALVE BODY (Continued)

- (5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.
- (6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).
- (7) Install shuttle valve as follows:
  - (a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.
  - (b) Install shuttle valve into housing.
  - (c) Hold shuttle valve in place.
  - (d) Compress secondary spring and install E-clip in groove at end of shuttle valve.
  - (e) Verify that spring and E-clip are properly seated before proceeding.
- (8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.
- (9) Install 1-2 and 2-3 valve governor plugs in valve body.
- (10) Install shuttle valve primary spring and throttle plug.
- (11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

## BOOST VALVE TUBE AND BRACE

- (1) Position valve body assembly so lower housing is facing upward (Fig. 320).
- (2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.
- (3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 320).
- (4) Insert and seat each end of tube in housings.
- (5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 321).
- (6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 321).

## VALVE BODY (Continued)

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 322).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

J9521-108

**Fig. 322 Securing Boost Valve Tube With Brace Tabs**

1 - BEND TABS UP AGAINST TUBE AS SHOWN

## 3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 323).

(2) Loosely attach accumulator housing with right-side screw (Fig. 323). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 324). Tighten screws to 4 N·m (35 in. lbs.).

J9321-160

## VALVE BODY (Continued)

## VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 325).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 326).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

J9521-178

J9121-54

**Fig. 326 Manual And Throttle Lever Alignment**

- 1 - THROTTLE LEVER
- 2 - MANUAL LEVER VALVE ARM
- 3 - MANUAL VALVE
- 4 - KICKDOWN VALVE

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 327). Seat tang in dimple before tightening connector screw.

808803a3

**Fig. 327 Solenoid Harness Case Connector Shoulder Bolt**

- 1 - SOLENOID HARNESS CASE CONNECTOR
- 2 - 3-4 ACCUMULATOR HOUSING

## VALVE BODY (Continued)

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 328). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

**Fig. 328 Solenoid Harness Routing**

- 1 - OVERDRIVE/CONVERTER SOLENOID WIRE HARNESS  
2 - 3-4 ACCUMULATOR COVER PLATE

## GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

## INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 329). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 330).

**Fig. 329 Valve Body Harness Connector O-Ring Seal**

- 1 - CONNECTOR O-RINGS  
2 - VALVE BODY HARNESS CONNECTOR  
3 - HARNESS

**Fig. 330 Manual Lever Shaft Seal**

- 1 - 15/16" SOCKET  
2 - SEAL

## VALVE BODY (Continued)

(3) Check condition of seals on accumulator piston (Fig. 331). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

**CAUTION:** It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, Automatic Transmission fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

## ADJUSTMENTS - VALVE BODY

## CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

**Fig. 331 Accumulator Piston Components**

- 1 - INNER SPRING
- 2 - ACCUMULATOR PISTON
- 3 - OUTER SPRING
- 4 - SEAL RINGS

## LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 332).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

**NOTE:** The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

**Fig. 332 Line Pressure Adjustment**

- 1 - WRENCH
- 2 - 1-5/16 INCH

## VALVE BODY (Continued)

## THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 333).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

**NOTE:** The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

J9521-109

## AUTOMATIC TRANSMISSION - 545RFE

### DESCRIPTION

The 545RFE automatic transmission is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability. The three planetary gear sets also make available a unique alternate second gear ratio. The primary 2nd gear ratio fits between 1st and 3rd gears for normal through-gear accelerations. The alternate second gear ratio (2prime) allows smoother 4-2 kickdowns at high speeds to provide 2nd gear passing performance over a wider highway cruising range. An additional overdrive ratio (0.67:1) is also provided for greater fuel economy and less NVH at highway speeds.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The TCM is the “heart” or “brain” of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

## TRANSMISSION IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan sealing surface (Fig. 1). Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

80af3150

**Fig. 1 Transmission Part And Serial Number Location**

1 - IDENTIFICATION NUMBERS (STAMPED)

## GEAR RATIOS

The 545RFE gear ratios are:

1st .....	3.00:1
2nd .....	1.67:1
2nd Prime .....	1.50:1
3rd .....	1.00:1
4th .....	0.75:1
5th .....	0.67:1
Reverse .....	3.00:1

## OPERATION

The 545RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmission includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output pressure greatly exceeds that which is needed to keep the clutches applied. The 545RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 545RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. It is also designed to maximize the benefit of the structural dust cover that connects the bottom of the bell housing to the engine bedplate, enhancing overall power train stiffness. Dual filters protect the pump and other components. A pump return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, SECOND, and THIRD gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

**CAUTION:** Before attempting any repair on a 545RFE automatic transmission, check for Diagnostic Trouble Codes with the DRB® scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

**DIAGNOSIS AND TESTING - PRELIMINARY**

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

**VEHICLE IS DRIVABLE**

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.
- (6) Perform air-pressure test to check clutch operation.

**VEHICLE IS DISABLED**

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift cable.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

**DIAGNOSIS AND TESTING - ROAD TESTING**

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

CLUTCH APPLICATION CHART

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

**DIAGNOSIS AND TESTING - HYDRAULIC  
PRESSURE TEST**

An accurate tachometer and pressure test gauges are required. Test Gauge C-3293-SP has a 300 psi range and is used at all locations where pressures exceed 100 psi.

**Pressure Test Port Locations**

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply and release ports are located on the right side of the transmission case (Fig. 2).

80ba79d0

**Fig. 2 Torque Converter Pressure Locations**

- 1 - TCC RELEASE
- 2 - TO COOLER
- 3 - TCC APPLY
- 4 - FROM COOLER
- 5 - LINE PRESSURE SENSOR

To determine the line pressure, there are two available methods. The DRB® scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter 8259 (Fig. 4) into the transmission case and then install the pressure gauge and the original sensor into the adapter. This will allow a comparison of the DRB® readings and the gauge reading to determine the accuracy of the line pressure sensor. The DRB® line pressure reading should match the gauge reading within  $\pm 10$  psi.

In order to access any other pressure tap locations, the transmission oil pan must be removed, the pressure port plugs removed and Valve Body Pressure Tap Adapter 8258-A (Fig. 5) installed. The extensions supplied with Adapter 8258-A will allow the installation of pressure gauges to the valve body. Refer to (Fig. 3) for correct pressure tap location identification.

80ba79d1

**Fig. 3 Pressure Tap Locations**

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

80c072fa

**Fig. 5 Valve Body Pressure Tap Adapter 8258-A**

1 - 545RFE TRANSMISSION  
2 - TOOL 8258-A

**TEST PROCEDURE**

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to the Hydraulic Schematics at the rear of this section to determine the correct pressures for each element in a given gear position.

**NOTE:** The 545RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures and the garage shift pressures. The upshift/downshift pressure for all shifts except the 4-5 shift is 120 psi. The upshift pressure for the 4-5 shift is 130 psi. The garage shift pressure when performing a N-R shift is 220 psi. The garage shift pressure for the R-N and N-1 shifts is 120 psi.

## DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH OPERATION

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with

the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown (Fig. 6).

80b9a594

**Fig. 6 Air Pressure Test Passages**

- 1 - LOW REVERSE CLUTCH
- 2 - 4TH CLUTCH
- 3 - 2ND CLUTCH
- 4 - OVERDRIVE CLUTCH
- 5 - UNDERDRIVE CLUTCH
- 6 - REVERSE CLUTCH

**NOTE:** The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

## DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the con-

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

verter. Pump cover seal tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye may be used to locate a leak.

**TORQUE CONVERTER LEAK POINTS**

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 7).
- (2) Leaks at the converter hub weld (Fig. 7).

80ceb25d

- 2 - STATOR
- 3 - CONVERTER HUB
- 4 - O-RING
- 5 - IMPELLER ASSEMBLY
- 6 - CONVERTER CLUTCH PISTON
- 7 - TURBINE HUB

**STANDARD PROCEDURE - ALUMINUM THREAD REPAIR**

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

**REMOVAL**

**CAUTION:** The transmission and torque converter must be removed as an assembly to avoid component damage. The converter driveplate, converter hub o-ring, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

- (1) Disconnect the negative battery cable.
- (2) Raise and support the vehicle
- (3) Mark propeller shaft and axle yokes for assembly alignment.
- (4) Remove the rear propeller shaft
- (5) Remove the front propeller shaft.
- (6) Remove the engine to transmission collar (Fig. 8).

80ba79d2

**Fig. 8 Transmission Collar**

- 1 - ENGINE
- 2 - ENGINE TO TRANSMISSION COLLAR
- 3 - TRANSMISSION

- (7) Remove the exhaust support bracket from the rear of the transmission.
- (8) Disconnect and lower or remove any necessary exhaust components.
- (9) Remove the starter motor.
- (10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
- (11) Disconnect wires from solenoid and pressure switch assembly, input and output speed sensors, and line pressure sensor.

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(12) Disconnect gearshift cable from transmission manual valve lever (Fig. 9).

**Fig. 9 Transmission Shift Cable**

- 1 - SHIFT CABLE
- 2 - MANUAL LEVER
- 3 - MANUAL LEVER

(13) Disconnect transfer case shift cable from the transfer case shift lever (Fig. 10).

(14) Remove the clip securing the transfer case shift cable into the cable support bracket.

**Fig. 10 Transfer Case Shift Cable**

- 1 - TRANSFER CASE SHIFT LEVER
- 2 - TRANSFER CASE SHIFT CABLE

(15) Disconnect transmission fluid cooler lines at transmission fittings and clips.

(16) Disconnect the transmission vent hose from the transmission.

(17) Support rear of engine with safety stand or jack.

(18) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(19) Remove bolts securing rear support and cushion to transmission and crossmember (Fig. 11).

(20) Remove bolts attaching crossmember to frame and remove crossmember.

**Fig. 11 Rear Transmission Crossmember**

- 1 - CROSSMEMBER
- 2 - REAR TRANSMISSION MOUNT

(21) Remove transfer case (Fig. 12) and (Fig. 13).

**Fig. 12 Remove NV247 Transfer Case**

- 1 - NV247 TRANSFER CASE

(22) Remove all remaining converter housing bolts.

(23) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(24) Hold torque converter in place during transmission removal.

(25) Lower transmission and remove assembly from under the vehicle.

(26) To remove torque converter, carefully slide torque converter out of the transmission.

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

80ba79c8

**Fig. 13 Remove NV242 Transfer Case**

1 - NV242 TRANSFER CASE

**DISASSEMBLY**

- (1) Drain fluid from transmission.
- (2) Clean exterior of transmission with suitable solvent or pressure washer.
- (3) Remove the torque converter from the transmission.
- (4) Remove the manual shift lever from the transmission.
- (5) Remove the input, output, and line pressure sensors from the transmission case (Fig. 14).

80c07350

**Fig. 14 Remove Input, Output, and Line Pressure Sensors**

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

(6) Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

(7) Install Support Stand 8257 onto the transmission case (Fig. 15).

80c07351

**Fig. 15 Install Support Stand - Tool 8257**

1 - TOOL 8257

- (8) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 16).

80c07352

**Fig. 16 Measure Input Shaft End Play**

- 1 - TOOL 8266
- 2 - TOOL C-3339

**NOTE:** When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(9) Remove the bolts holding the transmission extension/adaptor housing to the transmission case.

(10) Remove the extension/adaptor housing from the transmission case.

(11) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the output shaft end-play (Fig. 17).

80c07353

**Fig. 17 Measure Output Shaft End Play**

- 1 - TOOL 8261
- 2 - TOOL 8266
- 3 - TOOL C-3339

(12) Remove the bolts holding the transmission oil pan to the transmission case.

(13) Remove the transmission oil pan from the transmission case.

(14) Remove the primary oil filter and the oil cooler return filter (Fig. 18).

(15) Remove the cooler return filter bypass valve.

(16) Remove the bolts holding the valve body to the transmission case (Fig. 19).

(17) Remove the valve body from the transmission case.

80b9a595

**Fig. 18 Remove Primary Oil and Cooler Filters**

- 1 - PRIMARY OIL FILTER
- 2 - COOLER RETURN FILTER
- 3 - COOLER RETURN FILTER BYPASS VALVE

80c07354

**Fig. 19 Remove Valve Body Assembly**

- 1 - VALVE BODY TO CASE BOLT (6)

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(18) Remove the outer snap-ring securing the transmission front cover into the transmission case (Fig. 20).

(19) Remove the inner snap-ring securing the transmission front cover to the oil pump (Fig. 20).

**Fig. 20 Remove Transmission Front Cover**

- 1 - INNER SNAP-RING
- 2 - TRANSMISSION COVER
- 3 - OUTER SNAP-RING

(20) Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover from the transmission case.

(21) Remove the bolts holding the oil pump into the transmission case (Fig. 21).

(22) Remove the oil pump. Hold inward on the input shaft to prevent pulling the input clutch assembly with the oil pump (Fig. 21).

**NOTE:** If the input shaft is not held during oil pump removal, the input clutch assembly will attempt to move forward with the oil pump and the numbers 2, 3, or 4 bearings inside the input clutch assembly may become dislodged.

(23) Remove the number 1 bearing from the input clutch assembly (Fig. 22).

(24) Remove the input clutch assembly from the transmission case (Fig. 22).

(25) Remove the number 5 bearing and selective thrust plate from the input clutch assembly (Fig. 22), or the 4C clutch retainer/bulkhead.

**Fig. 21 Remove Oil Pump**

2 - BEARING NUMBER 9

3 - BEARING NUMBER 12

(41) Remove the snap-ring holding the low/reverse clutch retainer into the transmission case (Fig. 29).

(42) Remove the low/reverse clutch retainer from the transmission case (Fig. 29).

**Fig. 29 Remove Low/Reverse Clutch Retainer**

1 - LOW/REVERSE OVERRUNNING CLUTCH ASSEMBLY

2 - SNAP-RING

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

- (43) Remove the park pawl rod and e-clip (Fig. 30).
- (44) Remove the park pawl rod guide snap-ring (Fig. 30).
- (45) Remove the park pawl rod guide (Fig. 30).
- (46) Remove the park pawl pivot shaft, park pawl, and spring (Fig. 30).
- (47) Remove the manual selector shaft (Fig. 30).

808a3020

**Fig. 30 Manual Shaft/Park Lock Components**

- 1 - GUIDE
- 2 - SNAP-RING
- 3 - SHAFT
- 4 - SPRING
- 5 - PARK PAWL
- 6 - MANUAL SHAFT/LEVER
- 7 - PARK ROD

- (48) Remove the manual selector shaft seal.
- (49) Remove the dipstick tube seal.

**CLEANING**

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE:** Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

**INSPECTION**

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

**ASSEMBLY**

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install the cooler filter bypass valve.

(3) Torque the bypass valve to specification. The valve uses a tapered pipe thread and excessive torque can damage the transmission case. Tighten the cooler filter bypass valve to 4.5 N·m (40 in.lbs.).

(4) Install a new selector shaft seal using Seal Installer 8253 (Fig. 31).

80c07415

**Fig. 31 Install Selector Shaft**

- 1 - SEAL
- 2 - TOOL 8253

(5) Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N·m (250 in.lbs.).

(6) Install the park pawl, spring, and shaft (Fig. 32).

(7) Install the park rod and e-clip (Fig. 32).

(8) Install the park rod guide and snap-ring (Fig. 32).

(9) Install a new dipstick tube seal using Seal Installer 8254 (Fig. 33).

808a3020

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

**NOTE:** Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:

(10) Install the 2C reaction plate into the transmission case (Fig. 34).

(11) Install the 2C clutch pack into the transmission case (Fig. 34).

(12) Install the flat 2C clutch snap-ring into the transmission case (Fig. 34).

**Fig. 34 Install 2C Clutch Pack**

80c07359

- 1 - SNAP-RING
- 2 - PLATE
- 3 - DISC
- 4 - REACTION PLATE

(13) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.

(14) Install the 4C retainer/bulkhead tapered snap-ring into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

(15) Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.455-1.335 mm (0.018-0.053 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.

(16) Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

(17) Install the low/reverse clutch assembly (Fig. 35). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.

(18) Install the snap-ring to hold the low/reverse clutch retainer into the transmission case (Fig. 35). The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.

80c07411

**Fig. 35 Install Low/Reverse Clutch Retainer**

- 1 - LOW/REVERSE OVERRUNNING CLUTCH ASSEMBLY
- 2 - SNAP-RING

(19) Air check the low/reverse clutch and verify correct overrunning clutch operation.

(20) Install the number 12 bearing over the output shaft and against the rear planetary gear set. The flat side of the bearing goes toward the planetary gearset and the raised tabs on the inner race should face the rear of the transmission.

(21) Install the reverse/input planetary assembly through the low/reverse clutch assembly (Fig. 36).

80c07410

**Fig. 36 Install Input/Reverse Planetary Assembly**

- 1 - INPUT/REVERSE PLANETARY ASSEMBLY
- 2 - BEARING NUMBER 9
- 3 - BEARING NUMBER 12

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(22) Install the park sprag onto the output shaft (Fig. 37).

(23) Install the snap-ring to hold the park sprag onto the output shaft (Fig. 38).

80c07413

**Fig. 37 Install Park Sprag Gear**

1 - PARK SPRAG GEAR

80c07412

**Fig. 38 Install Park Sprag Snap-Ring**

1 - SNAP-RING

(24) Install the 2C reaction plate into the transmission case (Fig. 39).

(25) Install the 2C clutch pack into the transmission case (Fig. 39).

80c07359

**Fig. 39 Install 2C Clutch Pack**

1 - SNAP-RING  
2 - PLATE  
3 - DISC  
4 - REACTION PLATE

(26) Install the number 8 bearing inside the reaction carrier with the outer race against the reaction planetary carrier.

(27) Install the reaction planetary gear set and the number 9 bearing, with the inner race against the reaction planetary carrier, into the transmission case (Fig. 40).

(28) Install the flat 2C clutch snap-ring into the transmission case (Fig. 39).

(29) Install the reaction sun gear into the reaction planetary gear set. **Make sure** the small shoulder is facing the front of the transmission (Fig. 40).

(30) Install the number 7 bearing onto the reaction sun gear with the inner race against the sun gear (Fig. 40).

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

**Fig. 40 Install Reaction Annulus and Carrier**

80c07031

- 2 - BEARING NUMBER 9
- 3 - REACTION PLANETARY CARRIER
- 4 - REACTION SUN GEAR

- 5 - BEARING NUMBER 7
- 6 - THRUST PLATE (SELECT)
- 7 - BEARING NUMBER 6
- 8 - REACTION ANNULUS

(31) Install the output shaft selective thrust plate onto the reaction annulus with the oil grooves facing the annulus gear and the tabs and notches aligned as shown in (Fig. 41).

(32) Install the number 6 bearing against the output shaft selective thrust plate with the flat side against the thrust plate (Fig. 40) and the raised tabs on the inner race facing the front of the transmission.

(33) Install the reaction annulus into the reaction planetary gear set (Fig. 40).

80c07425

**Fig. 41 Thrust Plate Alignment**

- 1 - LOCATING LUG (3)
- 2 - THRUST PLATE

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(34) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the reaction annulus during the installation of the 4C retainer/bulkhead to ease installation.

(35) Install the 4C retainer/bulkhead tapered snap-ring into the transmission case (Fig. 42) with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

80ce60a3

**Fig. 42 Install 4C Clutch Retainer/Bulkhead**

- 1 - SNAP-RING
- 2 - 4C CLUTCH RETAINER/BULKHEAD

(36) Air check the 2C and 4C clutch operation.

(37) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the output shaft end-play (Fig. 43). The correct output shaft end-play is 0.22-0.55 mm (0.009-0.021 in.). Adjust as necessary. Install the chosen output shaft selective thrust plate and re-measure end-play to verify selection.

(38) Apply a bead of RTV silicone and install the extension/adaptor housing onto the transmission case.

(39) Install and torque the bolts to hold the extension/adaptor housing onto the transmission case. The correct torque is 54 N·m (40 ft.lbs.).

(40) Install the number 5 bearing and selective thrust plate onto the 4C retainer/bulkhead (Fig. 44). Be sure that the outer race of the bearing is against the thrust plate.

80c07353

**Fig. 43 Measure Output Shaft End Play**

- 1 - TOOL 8261
- 2 - TOOL 8266
- 3 - TOOL C-3339

(41) Install the input clutch assembly into the transmission case (Fig. 44). Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.

(42) Install the number 1 bearing with the outer race up in the pocket of the input clutch assembly (Fig. 44).

80c07357

**Fig. 44 Install Input Clutch Assembly**

- 1 - BEARING NUMBER 5
- 2 - THRUST PLATE (SELECT)
- 3 - INPUT CLUTCH ASSEMBLY
- 4 - BEARING NUMBER 1

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(43) Install the oil pump into the transmission case (Fig. 45).

(44) Install the bolts to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N·m (250 in.lbs.).

**Fig. 45 Install Oil Pump**

- 1 - OIL PUMP TO CASE BOLT (6)  
2 - OIL PUMP

(45) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 46). The correct end-play is 0.46-0.89 mm (0.018-0.035 in.). Adjust as necessary. Install the chosen thrust plate on the number 5 bearing and re-measure end-play to verify selection.

**NOTE:** When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

**Fig. 46 Measure Input Shaft End Play**

- 1 - TOOL 8266  
2 - TOOL C-3339

(46) Install the transmission front cover into the transmission case (Fig. 47).

(47) Install the outer snap-ring to hold the transmission front cover into the transmission case (Fig. 47).

(48) Partially install the inner transmission front cover snap-ring onto the oil pump (Fig. 47).

**Fig. 47 Install the Transmission Front Cover**

- 1 - INNER SNAP-RING  
2 - TRANSMISSION COVER  
3 - OUTER SNAP-RING

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(49) Using Installer 8255, install the inner transmission front cover snap-ring the remainder of the way onto the oil pump (Fig. 48).

80c07417

**Fig. 48 Seat Snap-Ring Using Tool 8255**

- 1 - TOOL 8255  
2 - SNAP-RING

(50) Install the valve body (Fig. 49). Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts to 12 N·m (105 in.lbs.).

80c07354

**Fig. 49 Install Valve Body Assembly**

- 1 - VALVE BODY TO CASE BOLT (6)

(51) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

**CAUTION:** The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

(52) Install the primary oil filter and the oil cooler return filter (Fig. 50). Tighten the screw to hold the primary oil filter to the valve body to 4.5 N·m (40 in.lbs.). Using Oil Filter Wrench 8321, tighten the cooler return oil filter to the transmission case to 14 N·m (125 in.lbs.).

80b9a595

**Fig. 50 Install Primary Oil and Cooler Filters**

- 1 - PRIMARY OIL FILTER  
2 - COOLER RETURN FILTER  
3 - COOLER RETURN FILTER BYPASS VALVE  
4 - VALVE BODY

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(53) Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N·m (105 in.lbs.).

(54) Install the input, output, and line pressure sensors (Fig. 51). Tighten the bolts to 12 N·m (105 in.lbs.).

**Fig. 51 Install Input, Output, and Line Pressure Sensors**

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

(55) Install the manual shift lever from the transmission. Torque the retaining cross-bolt to 16 N·m (140 in.lbs.).

## INSTALLATION

(1) Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.

(2) If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.

(3) Lubricate oil pump seal lip with transmission fluid.

(4) Align converter and oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 52). Surface of converter lugs

should be at least 13 mm (1/2 in.) to rear of straight-edge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

**Fig. 52 Checking Torque Converter Seating - Typical**

- 1 - SCALE
- 2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.

(11) Raise transmission and align the torque converter with the drive plate and the transmission converter housing with the engine block.

(12) Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.

(13) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.

(14) Install two bolts to attach the transmission to the engine.

(15) Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).

(16) Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).

(17) Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).

## AUTOMATIC TRANSMISSION - 545RFE (Continued)

(18) Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

(19) Remove engine support fixture.

(20) Install new plastic retainer grommet on any shift cable that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into cable and to snap grommet onto lever.

(21) Connect gearshift cable to transmission.

(22) Connect wires to solenoid and pressure switch assembly connector, input and output speed sensors, and line pressure sensor. Be sure transmission harnesses are properly routed.

**CAUTION:** It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(23) Install all torque converter-to-driveplate bolts by hand.

(24) Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 31 N·m (270 in. lbs.).

(25) Install starter motor and cooler line bracket.

(26) Connect cooler lines to transmission.

(27) Install transmission fill tube.

(28) Install exhaust components.

(29) Install transfer case. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).

(30) Install the transfer case shift cable to the cable support bracket and the transfer case shift lever.

(31) Install the structural dust cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION) onto the transmission and the engine.

(32) Align and connect propeller shaft(s).

(33) Adjust gearshift cable if necessary.

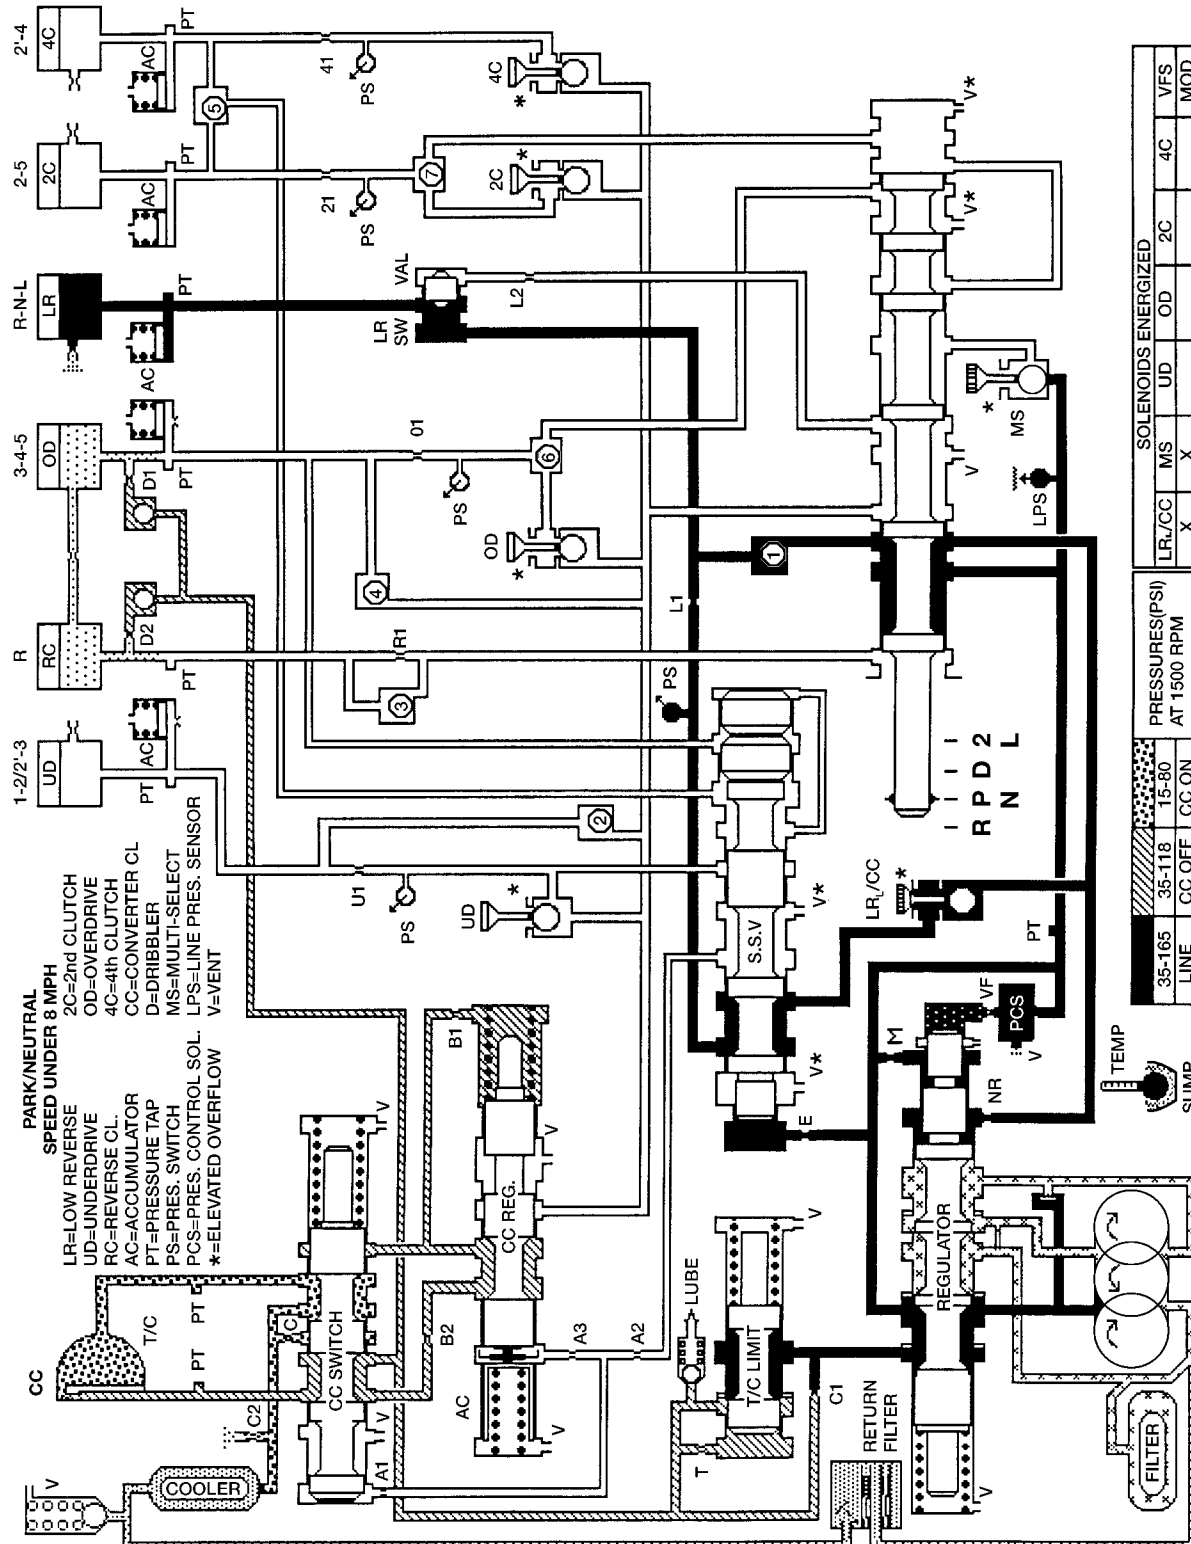

(34) Lower vehicle.

(35) Fill transmission with Mopar® ATF +4, Automatic Transmission fluid.

## 4C RETAINER/BULKHEAD

### DISASSEMBLY

- (1) Remove the 2C piston belleville spring snap-ring from the 4C retainer /bulkhead (Fig. 53).
- (2) Remove the 2C piston Belleville spring from the retainer/bulkhead (Fig. 53).
- (3) Remove the 2C piston from the retainer/bulkhead. Use 20 psi of air pressure to remove the piston if necessary.
- (4) Remove the 4C clutch snap-ring from the retainer/bulkhead (Fig. 53).
- (5) Remove the 4C clutch pack from the retainer/bulkhead (Fig. 53).
- (6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and remove the snap-ring (Fig. 53).

- (7) Remove the 4C piston return spring and piston from the retainer/bulkhead (Fig. 53). Use 20 psi of air pressure to remove the piston if necessary.

### ASSEMBLY

- (1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.
- (2) Install new seals on the 2C and 4C pistons (Fig. 53).
- (3) Lubricate all seals with Mopar® ATF +4 prior to installation.
- (4) Install the 4C piston into the 4C retainer/bulkhead (Fig. 53).
- (5) Position the 4C piston return spring onto the 4C piston.

80c07032

## 4C RETAINER/BULKHEAD (Continued)

(6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and install the snap-ring (Fig. 54).

80c07419

**Fig. 54 Compress 4C Piston Return Spring Using Tool 8250**

- 1 - PRESS  
2 - TOOL 8250

(7) Assemble and install the 4C clutch pack into the retainer/bulkhead (Fig. 53) with the steel separator plate against the piston.

(8) Install the 4C reaction plate and snap-ring into the retainer/bulkhead (Fig. 53). The 4C reaction plate is non-directional.

(9) Measure the 4C clutch clearance. The correct clutch clearance is 0.77-1.39 mm (0.030-0.055 in.). The snap-ring is selectable. Install the chosen snap-ring and re-measure to verify the selection.

(10) Install the 2C piston into the retainer/bulkhead (Fig. 53).

(11) Position the 2C Belleville spring onto the 2C piston.

(12) Position the 2C Belleville spring snap-ring onto the 2C Belleville spring (Fig. 53).

(13) Using Spring Compressor 8249 and a suitable shop press (Fig. 55), compress the belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.

## ADAPTER HOUSING SEAL

## REMOVAL

(1) Remove the transfer case from the transmission.

(2) Using a screw mounted on a slide hammer, remove the adapter housing seal.

80c07418

**Fig. 55 Compress 2C Belleville Spring Using Tool 8249**

- 1 - PRESS  
2 - TOOL 8249

## INSTALLATION

(1) Clean the adapter seal bore in the adapter housing of any residue or particles remaining from the original seal.

(2) Install new oil seal in the adapter housing using Seal Installer C-3860-A (Fig. 56). A properly installed seal is flush to the face of the seal bore.

80c07424

**Fig. 56 Adapter Housing Seal Installation**

- 1 - TOOL C-3860-A

(3) Install the transfer case onto the transmission.

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

### DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 57).

### OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shifter assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any gear position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

## DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

### SYSTEM VERIFICATION

- (1) Verify that the key can only be removed in the PARK position
- (2) When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
- (3) Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
- (4) Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
- (5) Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
- (6) Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

**Fig. 57 Ignition Interlock Cable**

4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

80dba6a6

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

## DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
KEY WILL NOT ROTATE TO THE OFF/LOCK POSITION.	1. Misadjusted Park Lock cable.	1. Adjust Park Lock cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)
	2. Misadjusted gearshift cable.	2. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)
	3. Burrs on ignition key.	3. Remove burrs and cycle key several times to verify operation.
	4. Binding or broken components.	4. Inspect system components and repair/replace components as necessary.
VEHICLE WILL NOT START UNLESS SHIFTER IS HELD FORWARD OF THE PARK POSITION.	1. Misadjusted gearshift cable.	1. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)

## ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

## ADJUSTMENT PROCEDURE

(1) Remove floor console as necessary for access to the brake transmission shift interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift the transmission into the PARK position.

(3) Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

(4) Pull cable lock button up to release cable (Fig. 58).

(5) Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.

(6) Push lock button down until it snaps in place.

## BTSI FUNCTION CHECK

(1) Verify removal of ignition key allowed in PARK position only.

(2) When the shift lever is in PARK, and the shift handle push-button is in the out position, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.

(3) Shifting out of PARK should be possible when the ignition key cylinder is in the off position.

(4) Shifting out of PARK should not be possible while applying normal push-button force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.

(6) Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

(7) The floor shifter lever and gate positions should be in alignment with all transmission detent positions.

(8) Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.

(9) With shifter lever handle push-button not depressed and lever detent in:

## BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

2 - SHIFTER BTSI LEVER  
3 - ADJUSTMENT CLIP

4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

- PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.

- PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.

- NEUTRAL position- engine start must be possible.

- NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

## FLUID AND FILTER

### DIAGNOSIS AND TESTING

#### DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing

the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

#### DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

(1) Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.

(2) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(3) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary

## FLUID AND FILTER (Continued)

transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

### DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE

### STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping

from the transmission vent where it may be mistaken for a leak.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82 C. or 180 F.), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 70° F fluid temperature.

**NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.**

- (1) Start engine and apply parking brake.
- (2) Shift the transmission into DRIVE for approximately 2 seconds.
- (3) Shift the transmission into REVERSE for approximately 2 seconds.
- (4) Shift the transmission into PARK.
- (5) Hook up DRB® scan tool and select transmission.
- (6) Select sensors.
- (7) Read the transmission temperature value.
- (8) Compare the fluid temperature value with the chart. (Fig. 59)
- (9) Adjust transmission fluid level shown on the dipstick according to the chart.

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

- (10) Check transmission for leaks.

### STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

#### REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission.

## FLUID AND FILTER (Continued)

80c072fc

**Fig. 59 Transmission Fluid Temperature Chart**

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolts holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screw holding filter to valve body (Fig. 60).

(10) Separate filter from valve body and oil pump and pour fluid in filter into drain pan.

(11) Remove and discard the oil filter seal from the bottom of the oil pump.

(12) If replacing the cooler return filter, use Oil Filter Wrench 8321 to remove the filter from the transmission.

(13) Dispose of used trans fluid and filter(s) properly.

80b9a595

**Fig. 60 Transmission Filters - 4X4 Shown**

- 1 - PRIMARY OIL FILTER
- 2 - COOLER RETURN FILTER
- 3 - COOLER RETURN FILTER BYPASS VALVE
- 4 - VALVE BODY

amounts of debris, refer to the diagnosis section of this group.

**CLEANING**

(1) Using a suitable solvent, clean pan and magnet.

**INSPECTION**

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive

## FLUID AND FILTER (Continued)

(2) Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

## INSTALLATION

(1) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

**CAUTION:** The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. **Damage to the transmission will result.**

(2) Place replacement filter in position on valve body and into the oil pump.

(3) Install screw to hold filter to valve body (Fig. 60). Tighten screw to 4.5 N·m (40 in. lbs.) torque.

(4) Install new cooler return filter onto the transmission, if necessary. Torque the filter to 14.12 N·m (125 in.lbs.).

(5) Place bead of Mopar® RTV sealant onto the transmission case sealing surface.

(6) Place pan in position on transmission.

(7) Install bolts to hold pan to transmission. Tighten bolts to 11.8 N·m (105 in. lbs.) torque.

(8) Lower vehicle and fill transmission with Mopar® ATF +4.

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4 to transmission:

(a) If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.

(3) Check the transmission fluid (Refer to 21 - TRANSMISSION/AUTOMATIC - RFE/FLUID - STANDARD PROCEDURE) and adjust as required.

## GEARSHIFT CABLE

## DIAGNOSIS AND TESTING - GEARSHIFT CABLE

(1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.

(2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.

(3) With floor shift lever handle push-button not depressed and lever in:

(a) PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.

(b) PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position - Normal position. Engine starts must be possible.

(d) NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

## REMOVAL

(1) Shift transmission into PARK.

(2) Raise vehicle.

(3) Remove the shift cable eyelet from the transmission manual shift lever (Fig. 61).

(4) Remove shift cable from the cable support bracket.

80ba79c4

**Fig. 61 Remove Shift Cable From Transmission**

- 1 - SHIFT CABLE
- 2 - MANUAL LEVER
- 3 - MANUAL LEVER

## GEARSHIFT CABLE (Continued)

- (5) Lower vehicle.
- (6) Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 62).
- (8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 63).
- (9) Pull cable through floor panel opening.

**Fig. 62 Transmission Shift Cable at Shifter**

- 1 - SHIFT LEVER PIN
- 2 - ADJUSTMENT SCREW
- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

**Fig. 63 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
- 2 - TRANSMISSION SHIFT CABLE
- 3 - TRANSFER CASE SHIFT CABLE

**INSTALLATION**

- (1) Route cable through hole in floor pan.
- (2) Install seal plate to studs in floor pan.
- (3) Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).
- (4) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
- (5) Place the floor shifter lever in PARK position.
- (6) Loosen the adjustment screw on the shift cable.
- (7) Snap the shift cable onto the shift lever pin.
- (8) Raise the vehicle.
- (9) Install the shift cable to the shift cable support bracket.
- (10) Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
- (11) Snap the shift cable onto the transmission manual shift lever.
- (12) Lower vehicle.
- (13) Verify that the shift lever is in the PARK position.
- (14) Tighten the adjustment screw to 7 N·m (65 in.lbs.).
- (15) Verify correct shifter operation.
- (16) Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

- (10) Remove shift cable from vehicle.

## GEARSHIFT CABLE (Continued)

**ADJUSTMENTS - GEARSHIFT CABLE**

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position switch or TRS may be faulty.

- (1) Shift transmission into PARK.
- (2) Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (3) Loosen the shift cable adjustment screw (Fig. 64).

**Fig. 64 Shift Cable at the Shifter**

- 1 - SHIFT LEVER PIN
- 2 - ADJUSTMENT SCREW
- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

- (4) Raise vehicle.
- (5) Unsnap cable eyelet from transmission shift lever (Fig. 65).

(6) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.

(7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.

- (8) Snap cable eyelet onto transmission shift lever.
- (9) Lower vehicle
- (10) Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
- (11) Verify correct operation.
- (12) Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## HOLDING CLUTCHES

### DESCRIPTION

Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (Fig. 66), while the Low/Reverse clutch is located at the rear of the transmission case (Fig. 67).

80c07032

**OPERATION****2C CLUTCH**

The 2C clutch is hydraulically applied in second and fifth gear by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reverse sun gear assembly is held or grounded to the transmission case by holding the reaction planetary carrier.

**4C CLUTCH**

The 4C clutch is hydraulically applied in second prime and fourth gear by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied,

the reaction annulus gear is held or grounded to the transmission case.

**LOW/REVERSE CLUTCH**

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

## INPUT CLUTCH ASSEMBLY

### DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 68) and (Fig. 69). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

### OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

### UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, second prime, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

### OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct), fourth, and fifth gears by pressurized fluid against the overdrive/reverse piston. When the

overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

**REVERSE CLUTCH**

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction annulus gear is driven.

**DISASSEMBLY**

(1) Remove the reverse reaction plate selective snap-ring from the input clutch retainer (Fig. 70).

(2) Remove the reverse reaction plate from the input clutch retainer.

(3) Remove the reverse hub and reverse clutch pack from the input clutch retainer.

(4) Remove the number 4 bearing from the overdrive hub.

(5) Remove the overdrive hub from the input clutch retainer (Fig. 70).

(6) Remove the number 3 bearing from the underdrive hub.

(7) Remove the OD/reverse reaction plate snap-ring from the input clutch retainer.

## INPUT CLUTCH ASSEMBLY (Continued)

(8) Remove the underdrive hub, overdrive clutch, and overdrive reaction plate from the input clutch retainer (Fig. 70).

**NOTE:** The overdrive friction discs and steel discs are thicker than the matching components in the underdrive and reverse clutches.

(9) Remove the number 2 bearing from the input clutch hub.

(10) Remove the overdrive clutch wave snap-ring from the input clutch retainer.

(11) Remove the UD/OD reaction plate tapered snap-ring from the input clutch retainer.

(12) Remove the UD/OD reaction plate from the input clutch retainer.

(13) Remove the UD/OD reaction plate flat snap-ring from the input clutch retainer (Fig. 70).

(16) Remove the UD/OD balance piston and piston return spring from the input clutch retainer (Fig. 72).

(17) Remove the underdrive piston from the input clutch retainer (Fig. 72).

**NOTE:** Both the UD/OD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.

(18) Remove the input clutch retainer tapered snap-ring.

(19) Separate input clutch retainer from input clutch hub.

(20) Separate OD/reverse piston from input clutch hub retainer (Fig. 72).

(21) Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

**ASSEMBLY**

(1) Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.

(2) Check the transmission lubrication check valve located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.

(3) Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.

(4) Assemble the OD/reverse piston onto the input clutch hub (Fig. 73).

(5) Assemble the input clutch retainer onto the input clutch hub.

## INPUT CLUTCH ASSEMBLY (Continued)

(17) Install the input clutch assembly into Input Clutch Pressure Fixture 8260 (Fig. 78). Mount a dial indicator to the assembly, push down on the clutch discs and zero the indicator against the underdrive clutch discs (Fig. 79). Apply 20 psi of air pressure to the underdrive clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 0.84-1.54 mm (0.033-0.061 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

80c07429

2 - REVERSE CLUTCH PACK

(27) Remove the reverse clutch pack from the input clutch retainer.

(28) Install the number 2 bearing onto the underdrive hub with outer race against the hub with petroleum jelly.

(29) Install the underdrive hub into the input clutch retainer.

(30) Install the number 3 bearing into the overdrive hub with the outer race against the hub with petroleum jelly.

(31) Install the overdrive hub into the input clutch retainer.

(32) Install the number 4 bearing into the reverse hub with outer race against the hub with petroleum jelly.

(33) Install the reverse hub into the input clutch retainer.

(34) Install the complete reverse clutch pack.

(35) Install the reverse reaction plate and snap-ring.

(36) Push up on reaction plate to allow reverse clutch to move freely.

## INPUT SPEED SENSOR

## DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

## INPUT SPEED SENSOR (Continued)

## REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the input speed sensor (Fig. 82).
- (4) Remove the bolt holding the input speed sensor to the transmission case.
- (5) Remove the input speed sensor from the transmission case.

80c07350

**Fig. 82 Input Speed Sensor**

- 1 - OUTPUT SPEED SENSOR  
2 - LINE PRESSURE SENSOR  
3 - INPUT SPEED SENSOR

## INSTALLATION

- (1) Install the input speed sensor into the transmission case.
- (2) Install the bolt to hold the input speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the input speed sensor
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

## LINE PRESSURE (LP) SENSOR

## DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, mounted on the side of the solenoid and pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump.

The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

## OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

## REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the line pressure sensor (Fig. 83).
- (4) Remove the bolt holding the line pressure sensor to the transmission case.
- (5) Remove the line pressure sensor from the transmission case.

80c07350

**Fig. 83 Line Pressure Sensor**

3 - INPUT SPEED SENSOR

## LINE PRESSURE (LP) SENSOR (Continued)

## INSTALLATION

- (1) Install the line pressure sensor into the transmission case.
- (2) Install the bolt to hold the line pressure sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the line pressure sensor
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

## LOW/REVERSE CLUTCH

## DISASSEMBLY

- (1) Remove the inner overrunning clutch snap-ring from the low/reverse clutch retainer (Fig. 84).
- (2) Remove the outer low/reverse reaction plate flat snap-ring (Fig. 84).
- (3) Remove the low/reverse clutch and the overrunning clutch from the low/reverse clutch retainer as an assembly (Fig. 84).

808a2e78

**Fig. 84 Low/Reverse Clutch Assembly**

- |                         |                         |

## LOW/REVERSE CLUTCH (Continued)

(4) Separate the low/reverse clutch from the overrunning clutch.

(5) Remove the overrunning clutch snap-ring (Fig. 85).

(6) Remove the spacer from the overrunning clutch (Fig. 85).

(7) Separate the inner and outer races of the overrunning clutch (Fig. 85).

(8) Remove the overrunning clutch lower snap-ring (Fig. 85).

**Fig. 85 Overrunning Clutch**

- 1 - SNAP-RING
- 2 - OUTER RACE
- 3 - OVERRUNNING CLUTCH
- 4 - SPACER

(9) Using Spring Compressor 8285 and a suitable shop press (Fig. 86), compress the low/reverse piston Belleville spring and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.

(10) Remove the low/reverse clutch Belleville spring and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

## CLEANING

Clean the overrunning clutch assembly, clutch cam, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

**Fig. 86 Compress Low/Reverse Belleville Spring Using Tool 8285**

80c07420

- 1 - PRESS
- 2 - TOOL 8285
- 3 - BELLEVILLE SPRING

Replace the low-reverse clutch retainer if the clutch race, roller surface or inside diameter is scored, worn or damaged.

## ASSEMBLY

(1) Check the bleed orifice to ensure that it is not plugged or restricted.

(2) Install a new seal on the low/reverse piston. Lubricate the seal with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.

(3) Install the low/reverse piston into the low/reverse clutch retainer.

(4) Position the low/reverse piston Belleville spring on the low/reverse piston.

(5) Using Spring Compressor 8285 and a suitable shop press (Fig. 86), compress the low/reverse piston Belleville spring and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.

(6) Install the lower overrunning clutch snap-ring (Fig. 85).

(7) Assemble the inner and outer races of the overrunning clutch (Fig. 85).

(8) Position the overrunning clutch spacer on the overrunning clutch.

(9) Install the upper overrunning clutch snap-ring (Fig. 85).

(10) Assemble and install the low/reverse clutch pack into the low/reverse clutch retainer (Fig. 84).

(11) Install the low/reverse reaction plate into the low/reverse clutch retainer (Fig. 84). The reaction plate is directional and must be installed with the flat side down.

## LOW/REVERSE CLUTCH (Continued)

(12) Install the low/reverse clutch pack snap-ring (Fig. 84). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.

(13) Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.00-1.74 mm (0.039-0.075 in.).

(14) Install the overrunning clutch into the low/reverse clutch retainer making sure that the index splines are aligned with the retainer.

(15) Install the overrunning clutch inner snap-ring.

## OIL PUMP

### DESCRIPTION

The oil pump (Fig. 87) is located at the front of the transmission inside the bell housing and behind the transmission front cover. The oil pump consists of two independent pumps (Fig. 88), a number of valves (Fig. 89), a front seal (Fig. 90), and a bolt on reaction shaft. The converter clutch switch and regulator valves, pressure regulator valve, and converter pressure limit valve are all located in the oil pump valve body.

**Fig. 87 Oil Pump**

- 1 - OIL PUMP TO CASE BOLT (6)  
2 - OIL PUMP

80c07356

### OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

80b9a592

**Fig. 88 Oil Pump Gears**

- 1 - PUMP HOUSING  
2 - DRIVE GEAR  
3 - DRIVEN GEARS

80b9a593

**Fig. 89 Oil Pump Valves**

- 1 - TORQUE CONVERTER CLUTCH ACCUMULATOR VALVE  
2 - TORQUE CONVERTER CLUTCH CONTROL VALVE  
3 - TORQUE CONVERTER CLUTCH SWITCH VALVE  
4 - PUMP VALVE BODY  
5 - PRESSURE REGULATOR VALVE  
6 - TORQUE CONVERTER CLUTCH LIMIT VALVE

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque converter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

### CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the hydraulic pressure supplied to the front (OFF) side of the torque converter clutch.

## OIL PUMP (Continued)

80c07011

1 - PUMP HOUSING  
2 - SEAL  
3 - OIL FILTER SEAL

4 - SEAL RING (5)  
5 - REACTION SHAFT SUPPORT  
6 - PUMP VALVE BODY

**CONVERTER CLUTCH REGULATOR VALVE**

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

**TORQUE CONVERTER LIMIT VALVE**

The torque converter limit valve serves to limit the available line pressure to the torque converter clutch.

**STANDARD PROCEDURE - OIL PUMP VOLUME CHECK**

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

**CAUTION:** With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine at **1800 rpm**, with the shift selector in neutral. Verify that the transmission fluid temperature is below 104.5° C (220° F) for this test.

## OIL PUMP (Continued)

(3) If one quart of transmission fluid is collected in the container in 30 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 30 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

(3) Remove all bolts holding the oil pump halves together (Fig. 91).

(4) Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

**NOTE:** The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.

## DISASSEMBLY

(1) Remove the bolts holding the reaction shaft support to the oil pump (Fig. 91).

(2) Remove the reaction shaft support from the oil pump (Fig. 91).

**Fig. 91 Oil Pump Assembly**

1 - PUMP HOUSING  
2 - SEAL  
3 - OIL FILTER SEAL

4 - SEAL RING (5)

## OIL PUMP (Continued)

(9) Remove the oil pump valve retainers and associated valve and spring one at a time (Fig. 93) (Fig. 94). Mark the combination of components as a group and tag them as to the location from which they were removed.

**Fig. 93 Oil Pump Valve Body**

- 1 - T/C REGULATOR VALVE
- 2 - T/C LIMIT VALVE
- 3 - REGULATOR VALVE
- 4 - OIL PUMP VALVE BODY

## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth

80c07421

**Fig. 94 T/C Switch Valve**

- 1 - RETAINER
- 2 - T/C SWITCH VALVE
- 3 - OIL PUMP VALVE BODY

but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump cover. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

## ASSEMBLY

(1) Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.

(2) Coat the gears with Mopar® ATF +4 and install into their original locations.

(3) Lubricate the oil pump valves with Mopar® ATF +4 and install the valve, spring and retainer

## OIL PUMP (Continued)

into the appropriate oil pump valve body bore (Fig. 93) (Fig. 94).

(4) Place the separator plate onto the oil pump body (Fig. 92).

(5) Install the screws to hold the separator plate onto the oil pump body (Fig. 92). Tighten the screws to 4.5 N·m (40 in.lbs.).

(6) Position the oil pump cover onto the locating dowels (Fig. 91).

(7) Seat the two oil pump halves together and install all bolts finger tight.

(8) Torque all bolts down slowly starting in the center and working outward. The correct torque is 4.5 N·m (40 in.lbs.).

(9) Verify that the oil pump gears rotate freely and smoothly.

(10) Position the reaction shaft support into the oil pump (Fig. 91).

(11) Install and torque the bolts to hold the reaction shaft support to the oil pump (Fig. 91). The correct torque is 12 N·m (105 in.lbs.).

80c07423

**Fig. 95 Install Oil Pump Front Seal**

1 - TOOL C-3860-A

## OIL PUMP FRONT SEAL

## REMOVAL

- (1) Remove transmission from the vehicle.
- (2) Remove the torque converter from the transmission.
- (3) Using a screw mounted in a slide hammer, remove the oil pump front seal.

## INSTALLATION

- (1) Clean seal bore of the oil pump of any residue or particles from the original seal.
- (2) Install new oil seal in the oil pump housing using Seal Installer C-3860-A (Fig. 95).

## OUTPUT SPEED SENSOR

## DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

## OUTPUT SPEED SENSOR (Continued)

**REMOVAL**

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the output speed sensor (Fig. 96).
- (4) Remove the bolt holding the output speed sensor to the transmission case.
- (5) Remove the output speed sensor from the transmission case.

80c07350

**Fig. 96 Output Speed Sensor**

- 1 - OUTPUT SPEED SENSOR  
2 - LINE PRESSURE SENSOR  
3 - INPUT SPEED SENSOR

**INSTALLATION**

- (1) Install the output speed sensor into the transmission case.
- (2) Install the bolt to hold the output speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the output speed sensor.
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

**OVERDRIVE SWITCH****DESCRIPTION**

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

**OPERATION**

At key-on, fourth and fifth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoids and allow upshifts to fourth and fifth gears. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

**PARK LOCK CABLE****REMOVAL**

- (1) Place the shifter in the PARK position.
- (2) Lower the steering column cover.
- (3) With the ignition switch in the "RUN" position depress the park lock cable locking tab, located on top of the cable connector at the steering column and pull the park lock cable straight out.
- (4) Remove the park lock cable from steering column (Fig. 97).
- (5) Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (6) Disconnect the park lock cable from the shift BTSI lever and remove the cable from the shifter assembly bracket.
- (7) Release the park lock cable from any remaining clips.
- (8) Remove park lock cable from the vehicle.

## PARK LOCK CABLE (Continued)

80dba6a6

**Fig. 97 Brake Transmission Shift Interlock**

1 - SHIFT MECHANISM  
2 - SHIFTER BTSI LEVER  
3 - ADJUSTMENT CLIP

4 - STEERING COLUMN ASSEMBLY  
5 - INTERLOCK CABLE

**INSTALLATION**

**NOTE:** The gearshift cable must be secured into position and properly adjusted before the installation of the Park Lock Cable.

- (1) Verify that the shifter is in the PARK position.
- (2) Push the park lock cable straight into the square mounting hole in the steering column until cable snaps in place.
- (3) Route park lock cable to the shifter mechanism.
- (4) Install the park lock cable end fitting into shifter BTSI lever.

- (5) Pull rearward on the cable housing to snap park lock cable adjuster ears into floor shifter bracket.

- (6) Place the ignition key cylinder in the ACCESSORY position.

- (7) Push the cable adjuster lock clamp downward to lock it.

- (8) Test the park lock cable operation.

- (9) Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## PISTONS

### DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

### OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

### PRESSURE

Pressure (Fig. 98) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

Fig. 98 Force and Pressure Relationship

### PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 99) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

80bfe273

Fig. 99 Pressure on a Confined Fluid

## PISTONS (Continued)

## FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 100), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 100), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

80bfe274

Fig. 100 Force Multiplication

## PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 101) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

80bfe275

Fig. 101 Piston Travel

## PLANETARY GEARTRAIN

### DESCRIPTION

The planetary geartrain is located behind the 4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of three primary assemblies:

- Reaction (Fig. 102).
- Reverse (Fig. 103).
- Input (Fig. 103).

### OPERATION

#### REACTION PLANETARY GEARTRAIN

The reaction planetary carrier and reverse sun gear of the reaction planetary geartrain are a single component which is held by the 2C clutch when required. The reaction annulus gear is a stand alone component that can be driven by the reverse clutch

or held by the 4C clutch. The reaction sun gear is driven by the overdrive clutch.

#### REVERSE PLANETARY GEARTRAIN

The reverse planetary geartrain is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is also splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse planetary annulus, input planetary carrier, and output shaft are all one piece.

#### INPUT PLANETARY GEARTRAIN

The input sun gear of the input planetary geartrain is driven by the underdrive clutch.

- 3 - BEARING NUMBER 11
- 4 - INPUT ANNULUS

- 5 - INPUT PLANETARY CARRIER
- 6 - INPUT SUN GEAR
- 7 - REVERSE PLANETARY CARRIER

**DISASSEMBLY**

- (1) Remove the snap-ring holding the input annulus into the input carrier (Fig. 104).
- (2) Remove the input annulus from the input carrier (Fig. 104).
- (3) Remove the number 9 bearing from the reverse planetary carrier. Note that this planetary carrier has four pinion gears.
- (4) Remove the reverse planetary gear carrier (Fig. 104).
- (5) Remove the number 10 bearing from the input sun gear (Fig. 104).
- (6) Remove the input sun gear from the input carrier (Fig. 104).
- (7) Remove the number 11 bearing from the input carrier (Fig. 104).

**CLEANING**

Clean the planetary components in solvent and dry them with compressed air.

**INSPECTION**

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

## PLANETARY GEARTRAIN (Continued)

 3 - BEARING NUMBER 11  
 4 - INPUT ANNULUS

5 - INPUT PLANETARY CARRIER  
 6 - INPUT SUN GEAR  
 7 - REVERSE PLANETARY CARRIER

**ASSEMBLY**

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install the number 11 bearing into the input planetary carrier so that the inner race will be toward the front of the transmission (Fig. 104).

(3) Install the input sun gear into the input carrier (Fig. 104).

(4) Install the number 10 bearing onto the rear of the reverse planetary carrier with the inner race toward the carrier (Fig. 104).

(5) Install the number 9 bearing onto the front of the reverse planetary carrier with the outer race toward the carrier and the inner race facing upward (Fig. 104).

(6) Install the reverse planetary gear carrier into the input carrier (Fig. 104).

(7) Install the input annulus gear into the input carrier (Fig. 104).

(8) Install the snap-ring to hold the input annulus gear into the input carrier (Fig. 104).

## SHIFT MECHANISM

### DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

### OPERATION

MANUAL LOW (1) range provides FIRST gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides FIRST and SECOND gear only.

DRIVE range provides FIRST, SECOND, THIRD and OVERDRIVE FOURTH and FIFTH gear ranges. The shift into OVERDRIVE FOURTH and FIFTH gear range occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 or 4-5 shifts.

The FOURTH and FIFTH gear upshifts occurs automatically when the overdrive selector switch is in the ON position. An upshift to FOURTH and FIFTH gears may not occur or may be delayed in some of the possible shift schedules. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - OPERATION)

### REMOVAL

- (1) Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (2) Shift transmission into PARK.
- (3) Disconnect the transmission shift cable at shift lever and shifter assembly bracket (Fig. 105).
- (4) Disconnect the park lock cable from the shifter BTSI lever and the shifter assembly bracket. (Fig. 106)
- (5) Disconnect the transfer case shift cable from the transfer case shift lever pin (Fig. 107), if equipped.
- (6) Remove the clip holding the transfer case shift cable to the shifter assembly bracket, if equipped.
- (7) Remove the transfer case shift cable from the shifter assembly bracket, if equipped.
- (8) Disengage all wiring connectors from the shifter assembly.
- (9) Remove all nuts holding the shifter assembly to the floor pan (Fig. 108).
- (10) Remove the shifter assembly from the vehicle.

80dbaaaa

**Fig. 105 Transmission Shift Cable**

- 1 - SHIFT LEVER PIN
- 2 - ADJUSTMENT SCREW
- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

### INSTALLATION

- (1) Install shifter assembly onto the shifter assembly studs on the floor pan.
- (2) Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).
- (3) Place the floor shifter lever in PARK position.
- (4) Loosen the adjustment screw on the shift cable.
- (5) Verify that the park lock cable adjustment tab is pulled upward to the unlocked position.
- (6) Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.
- (7) Install the transfer case shift cable to the shifter assembly bracket. Install clip to hold cable to the bracket.
- (8) Snap the transfer case shift cable, if equipped, onto the transfer case shift lever pin.
- (9) Install the park lock cable into the shifter assembly bracket and into the shifter BTSI lever. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)
- (10) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
- (11) Snap the shift cable onto the shift lever pin.
- (12) Verify that the shift lever is in the PARK position.
- (13) Tighten the adjustment screw to 7 N·m (65 in.lbs.).
- (14) Place the key in the accessory position.
- (15) Push downward on the park lock cable adjustment tab to lock the adjustment.
- (16) Verify correct shifter, park lock, and BTSI operation.

## SOLENOID SWITCH VALVE

### DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the valve body and controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

### OPERATION

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and 5th gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

## SOLENOIDS

### DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

### OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## TORQUE CONVERTER

### DESCRIPTION

The torque converter (Fig. 109) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy

## TORQUE CONVERTER (Continued)

when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump and contains an o-ring seal to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION:** The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

## IMPELLER

The impeller (Fig. 110) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

## TORQUE CONVERTER (Continued)

**TURBINE**

The turbine (Fig. 111) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

- 6 - OIL FLOW WITHIN TURBINE SECTION

## TORQUE CONVERTER (Continued)

## STATOR

The stator assembly (Fig. 112) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 113). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

Fig. 112 Stator Components

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 114) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

## TORQUE CONVERTER (Continued)

## OPERATION

The converter impeller (Fig. 115) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 116). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is

redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

80bfe26e

Fig. 116 Stator Operation

## TORQUE CONVERTER (Continued)

## TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

## NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

## PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

## FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

## GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

## REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION:** Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.
- (4) Separate the torque converter from the transmission.

## INSTALLATION

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate oil pump seal lip with transmission fluid.
- (2) Place torque converter in position on transmission.

**CAUTION:** Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

## TORQUE CONVERTER (Continued)

(6) Check converter seating with a scale and straightedge (Fig. 117). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straight-edge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

Fig. 117 Checking Torque Converter Seating-Typical

1 - SCALE  
2 - STRAIGHTEDGE

## TRANSMISSION CONTROL RELAY

## DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

## OPERATION

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

## TRANSMISSION RANGE SENSOR

## DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.
- Supply +12 V to the backup lamps in Reverse only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

## OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Seven of these possible codes are related to gear position and five are recognized as "between gear" codes. This results in many codes which should **never occur**. These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

## TRANSMISSION SOLENOID/ TRS ASSEMBLY

### DESCRIPTION

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly (Fig. 118). The assembly consists of six solenoids that control hydraulic pressure to the six friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains five pressure switches that feed information to the TCM.

80ceb3ca

**Fig. 118 Transmission Solenoid/TRS Assembly**

- 1 - PRESSURE CONTROL SOLENOID
- 2 - TRANSMISSION RANGE SELECTOR PLATE
- 3 - 23-WAY CONNECTOR
- 4 - SOLENOID PACK
- 5 - TRANSMISSION RANGE SENSOR
- 6 - VALVE BODY

### OPERATION

#### SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The solenoid and pressure switch assembly contains one additional solenoid, Multi-Select (MS), which serves primarily to provide 2nd and 3rd gear limp-in operation.

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as

necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied to allow transmission limp-in in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

### PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at 23 psi and open at 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

GEAR	L/R	2C	4C	UD	OD
R	OP	OP	OP	OP	OP
P/N	CL	OP	OP	OP	OP
1ST	CL*	OP	OP	CL	OP
2ND	OP	CL	OP	CL	OP
2ND PRIME	OP	OP	CL	CL	OP
D	OP	OP	OP	CL	CL
4TH	OP	OP	CL	OP	CL
5TH	OP	CL	OP	OP	CL

\*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

## TRANSMISSION SOLENOID/TRS ASSEMBLY (Continued)

**REMOVAL**

(1) Remove the valve body from the transmission (Fig. 119).

**Fig. 119 Valve Body Bolts**

1 - VALVE BODY TO CASE BOLT (6)

(2) Remove the screws holding the transmission solenoid/TRS assembly onto the valve body (Fig. 120).

(3) Separate the transmission solenoid/TRS assembly from the valve body.

**Fig. 120 Transmission Solenoid/TRS Assembly Screws**

1 - SOLENOID PACK BOLTS (15)

**INSTALLATION**

(1) Place TRS selector plate in the PARK position.

(2) Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate.

(3) Install the screws to hold the transmission solenoid/TRS assembly onto the valve body.

(4) Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 5.7 N·m (50 in.lbs.).

(5) Tighten the remainder of the solenoid assembly screws to 5.7 N·m (50 in.lbs.).

(6) Install the valve body into the transmission.

**TRANSMISSION TEMPERATURE SENSOR****DESCRIPTION**

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

**OPERATION**

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and converter lock up, the TCM requires this information to determine which shift schedule to operate in.

**Calculated Temperature**

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

## VALVE BODY

### DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 121) and (Fig. 122):

- Solenoid switch valve
- Manual valve
- Low/reverse switch valve
- 5 Accumulators
- 7 check balls

80c072f1

**Fig. 122 Check Ball Locations**

### OPERATION

**NOTE:** Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

- 7 - UNDERDRIVE ACCUMULATOR
- 8 - 4C ACCUMULATOR
- 9 - 2C ACCUMULATOR

## VALVE BODY (Continued)

## SOLENOID SWITCH VALVE

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and fifth gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

## MANUAL VALVE

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically by a cable to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (Fig. 123) that engages the "roostercomb" of the TRS selector plate.

80c072f3

**Fig. 123 TRS Selector Plate and Detent Spring**

- 1 - TRS SELECTOR PLATE
- 2 - DETENT SPRING
- 3 - CLUTCH PASSAGE SEALS

## LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

## REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/VALVE BODY - DISASSEMBLY)

- (1) Shift transmission into PARK.
  - (2) Raise vehicle.
  - (3) Disconnect wires at the solenoid and pressure switch assembly connector.
  - (4) Position drain pan under transmission oil pan.
  - (5) Remove transmission oil pan.
  - (6) Remove the primary oil filter from valve body.
- (Fig. 124)

80b9a595

**Fig. 124 Remove Primary Oil Filter**

## VALVE BODY (Continued)

(7) Remove bolts attaching valve body to transmission case (Fig. 125).

(8) Lower the valve body and work the electrical connector out of transmission case.

(9) Separate the valve body from the transmission.

**Fig. 125 Valve Body Bolts**

1 - VALVE BODY TO CASE BOLT (6)

## DISASSEMBLY

(1) Remove the screws holding the solenoid and pressure switch assembly to the valve body (Fig. 126). Do not remove the screws on the top of the solenoid and pressure switch assembly.

(2) Separate the solenoid and pressure switch assembly from the valve body.

(3) Remove the screw holding the detent spring (Fig. 127) onto the valve body.

(4) Remove the detent spring from the valve body.

(5) Remove the TRS selector plate from the valve body and the manual valve.

(6) Remove the clutch passage seals from the valve body, if necessary.

## VALVE BODY (Continued)

(7) Remove the screws holding the accumulator cover onto the valve body (Fig. 128).

(8) Remove the accumulator springs and pistons from the valve body. Note which accumulator piston and spring belong in each location.

(9) Place the valve body on the bench with the transfer plate upward.

**NOTE:** The valve body contains seven check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.

(10) Remove the screws holding the valve body to the valve body transfer plate.

(11) Remove the transfer plate from the valve body. Note the location of all check balls (Fig. 129).

(12) Remove the check balls from the valve body.

80c072f1

- 7 - OVERDRIVE ACCUMULATOR
- 8 - 4TH CLUTCH ACCUMULATOR
- 9 - CHECK BALLS (7)

**CLEANING**

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution. (Fig. 131)

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

80b9a599

## VALVE BODY (Continued)

## INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs (Fig. 132) for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

80b9a599

**Fig. 132 Valve Body Components**

- 1 - SOLENOID SWITCH VALVE
- 2 - MANUAL VALVE
- 3 - LOW REVERSE SWITCH VALVE
- 4 - LOW REVERSE ACCUMULATOR
- 5 - 2ND CLUTCH ACCUMULATOR
- 6 - UNDERDRIVE ACCUMULATOR
- 7 - OVERDRIVE ACCUMULATOR
- 8 - 4TH CLUTCH ACCUMULATOR
- 9 - CHECK BALLS (7)

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Inspect all the fluid seals on the valve body (Fig. 133). Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

80b9a591

**Fig. 133 Valve Body Seals**

- 8 - OVERDRIVE ACCUMULATOR (1 SPRING)

## VALVE BODY (Continued)

## ASSEMBLY

(1) Lubricate valves, springs, and the housing valve bores with clean transmission fluid.

(2) Install solenoid switch valve, manual valve, and the low/reverse switch valve into the valve body.

(3) Install the retainers to hold each valve into the valve body.

(4) Install the valve body check balls into their proper locations.

(5) Position the transfer plate onto the valve body.

(6) Install the screws to hold the transfer plate to the valve body. Tighten the screws to 5.6 N·m (50 in. lbs.).

(7) Install the accumulator pistons and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston has only one spring.

(8) Position the accumulator cover onto the valve body.

(9) Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 8 N·m (70 in. lbs.).

(10) Install the TRS selector plate onto the valve body and the manual valve.

(11) Install the solenoid and pressure switch assembly onto the valve body.

(12) Install the screws to hold the solenoid and pressure switch assembly onto the valve body. Tighten the screws to 5.7 N·m (50 in. lbs.). Tighten the screws adjacent to the arrows cast into the bottom of the transfer plate first.

(13) Position the detent spring onto the valve body.

(14) Install the screw to hold the detent spring onto the valve body. Tighten the screw to 4.5 N·m (40 in. lbs.).

(15) Install new clutch passage seals onto the valve body, if necessary

## INSTALLATION

(1) Check condition of seals on valve body and the solenoid and pressure switch assembly. Replace seals if cut or worn.

(2) Place TRS selector plate in the PARK position.

(3) Place the transmission in the PARK position.

(4) Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.

(5) Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.

(6) Seat valve body in case and install one or two bolts to hold valve body in place.

(7) Tighten valve body bolts alternately and evenly to 12 N·m (105 in. lbs.) torque.

(8) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

**CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.**

(9) Place replacement filter in position on valve body and into the oil pump.

(10) Install screw to hold filter to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.

(11) Connect the solenoid and pressure switch assembly connector.

(12) Install oil pan. Tighten pan bolts to 12 N·m (105 in. lbs.) torque.

(13) Lower vehicle and fill transmission with Mopar® ATF +4.

(14) Check and adjust gearshift cable, if necessary.

TRANSFER CASE - NV147

DESCRIPTION

The NV147 (Fig. 1) is an on-demand 4-wheel drive transfer case with one operating range. The only operating range is 4-high.

Fig. 1 NV147 Transfer Case

810c1654

TRANSFER CASE IDENTIFICATION

A circular I.D. tag is attached to the rear case of each NV147 transfer case (Fig. 2). The tag indicates the following information:

- Model number.
- Serial number.
- Assembly number.
- Gear ratio.
- Location of manufacture.

The transfer case serial number also represents the date of build.

80ba7a32

Fig. 2 Transfer Case I.D. Tag

2 - I.D. TAG  
3 - DRAIN PLUG

## TRANSFER CASE - NV147 (Continued)

**OPERATION**

Under normal driving conditions, the system operates conventionally, and the majority of available torque is applied to the rear wheels. However, when front-to-rear wheel speed variations exist, the progressive differential transfers torque to the axle with the better traction, thus minimizing wheel spin and maximizing control.

The key to this design is a progressive coupling (Fig. 3), which is supplied with pressurized oil by a gerotor style pump. The pump rotor and case are driven by the front and rear driveshafts respectively, and deliver pressurized oil flow to the coupling in proportion to their speed difference. The progressive coupling contains a multi-disc clutch pack that is alternately splined to the front and rear driveshafts, and controls torque variation between the front and rear driveshafts as dictated by the pump.

A set of orifices and valves control the speed-differential starting point and rate of torque transfer rise in the clutch. This allows the system to disregard the normal speed differences between axles that result from variations in front-to-rear loading and typical cornering.

80ba7a55

**Fig. 3 Progressive Coupling****DIAGNOSIS AND TESTING - TRANSFER CASE - NV147**

CONDITION	POSSIBLE CAUSE	CORRECTION
TRANSFER CASE NOISY IN ALL MODES	1. Insufficient or incorrect lubricant	1. Drain and refill to edge of fill hole with correct lubricant. <b>If unit is still noisy after drain and refill, disassembly and inspection may be required to locate source of noise</b>
LUBRICANT LEAKING FROM OUTPUT SHAFT SEALS OR FROM VENT	1. Transfer case over filled	1. Drain to correct level
	2. Vent closed or restricted	2. Clear or replace vent if necessary
	3. Output shaft seals damaged or installed correctly	3. Replace seals. Be sure seal lip faces interior of case when installed. Also be sure yoke seal surfaces are not scored or nicked. Remove scores and nicks with fine sandpaper or replace yoke(s) if necessary.

## TRANSFER CASE - NV147 (Continued)

**REMOVAL**

- (1) Raise vehicle.
- (2) Remove transfer case drain plug and drain transfer case lubricant.
- (3) Mark front and rear propeller shaft yokes for alignment reference.
- (4) Support transmission with jack stand.
- (5) Remove rear crossmember and skid plate, if equipped (Fig. 4).

80ba79c7

**Fig. 4 Crossmember Removal**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

(6) Disconnect front propeller shaft from transfer case at companion flange. Remove rear propeller shaft from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

**CAUTION:** Do not allow propshafts to hang at attached end. Damage to joint can result.

- (7) Disconnect transfer case vent hose.
- (8) Support transfer case with transmission jack.
- (9) Secure transfer case to jack with chains.
- (10) Remove nuts attaching transfer case to transmission.
- (11) Pull transfer case and jack rearward to disengage transfer case.
- (12) Remove transfer case from under vehicle.

**DISASSEMBLY**

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

**REAR RETAINER AND OIL PUMP**

- (1) Remove rear retainer bolts (Fig. 5).
- (2) Remove rear bearing locating ring access plug (Fig. 6).

810c241a

**Fig. 5 Rear Retainer Bolt Removal**

- 1 - REAR RETAINER

80ba7a33

**Fig. 6 Remove Rubber Access Plug**

- 1 - PLUG

## TRANSFER CASE - NV147 (Continued)

(3) Loosen rear retainer with pry tool to break sealer bead. Pry only against retainer boss as shown (Fig. 7).

(4) Remove rear retainer as follows:

(a) Spread rear bearing locating ring with snap ring pliers (Fig. 8).

(b) Then slide retainer off mainshaft and rear bearing (Fig. 9).

810c2448

- 2 - PRY TOOL
- 3 - SEALER BEAD
- 4 - REAR RETAINER

810c1ebe

**Fig. 9 Rear Retainer Removal**

- 1 - REAR CASE
- 2 - REAR RETAINER

(5) Remove rear bearing snap-ring.

(6) Remove rear bearing. Note position of bearing locating ring groove for assembly reference.

(7) Disengage oil pickup tube from oil pump and remove oil pump assembly (Fig. 10).

(8) Remove pick-up tube o-ring from oil pump (Fig. 11), if necessary. Do not disassemble the oil pump, it is not serviceable.

810c1ec4

**Fig. 8 Disengaging Rear Bearing Locating Ring**

**Fig. 11 Pick-up Tube O-ring Location**

- 1 - OIL PUMP  
2 - O-RING

J9321-14

**Fig. 13 Loosening Rear Case**

- 1 - REAR CASE  
2 - PRY TOOL (IN CASE SLOT)  
3 - FRONT CASE

**COMPANION FLANGE**

(1) Remove front companion flange nut with socket and impact wrench.

(2) Remove companion flange. If flange is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller. Be sure puller tool is positioned on flange and not on slinger, as slinger will be damaged.

(3) Remove seal washer from front output shaft. Discard washer as it should not be reused.

**REAR CASE**

(1) Support transfer case so rear case is facing upward.

(2) Remove bolts holding front case to rear case. The case alignment bolt require flat washers (Fig. 12).

(3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert screwdriver blade only into notches provided at each end of case (Fig. 13).

(4) Remove rear case (Fig. 14).

J9321-13

**Fig. 12 Rear Case Alignment Bolt Locations**

- 1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

810c189d

**Fig. 14 Rear Case Removal**

## TRANSFER CASE - NV147 (Continued)

**PROGRESSIVE COUPLING**

(1) Remove oil pump locating snap-ring and progressive coupling thrust washer from the mainshaft (Fig. 15).

(2) Remove progressive coupling from mainshaft (Fig. 15).

**Fig. 15 Progressive Coupling Removal**

- 1 - SNAP-RING
- 2 - PROGRESSIVE COUPLING

**FRONT OUTPUT SHAFT AND DRIVE CHAIN**

(1) Remove oil pickup tube from rear case (Fig. 16).

(2) Remove drive gear snap-ring (Fig. 17).

(3) Disengage drive gear (Fig. 17). Pry gear upward and off mainshaft as shown.

(4) Remove front output shaft, drive chain and drive gear as assembly (Fig. 17).

(5) Remove output shaft drive gear snap ring.

(6) Remove output shaft drive gear from output shaft.

**Fig. 16 Oil Pickup Tube Removal**

- 1 - OIL PICKUP TUBE

**Fig. 17 Front Output Shaft, Drive Gear And Chain Removal**

- 1 - REAR HOUSING
- 2 - OUTPUT SHAFT AND SPROCKET
- 3 - MAINSHAFT SPROCKET
- 4 - SNAP-RING
- 5 - DRIVE CHAIN

**MAINSHAFT**

(1) Remove mainshaft from the input gear pilot bearing.

**NOTE:** Loose needle bearings are used to support the drive sprocket hub on the mainshaft. Do not lift mainshaft by drive sprocket hub or needle bearings will become dislodged.

(2) Wrap rag around mainshaft underneath drive sprocket hub and remove drive sprocket hub from mainshaft. Be sure to retrieve all the drive sprocket hub needle bearings.

## TRANSFER CASE - NV147 (Continued)

## INPUT GEAR

(1) Turn front case on side so front bearing retainer is accessible.

(2) Remove front bearing retainer bolts (Fig. 18).

(3) Remove front bearing retainer as follows:

(a) Loosen retainer with flat blade screwdriver to break sealer bead. **To avoid damaging case and retainer, position screwdriver blade only in slots provided in retainer (Fig. 19).**

(b) Then remove retainer from case and gear.

**Fig. 18 Front Bearing Retainer Bolt Removal**

1 - FRONT BEARING RETAINER

**Fig. 19 Front Bearing Retainer Removal**

1 - FRONT BEARING RETAINER  
2 - RETAINER NOTCH  
3 - FLAT BLADE SCREWDRIVER

(4) Remove snap-ring that retains input gear shaft in front bearing (Fig. 20).

**Fig. 20 Input Gear Snap-Ring Removal**

1 - INPUT GEAR  
2 - SNAP-RING

(5) Remove oil seals from following components:

- front bearing retainer.
- rear retainer.
- case halves.

## CLEANING

Clean the transfer case components with parts cleaning solvent. Flush the oil passages in the cases and drivetrain components with solvent. This will help remove dirt and particles from these passages.

Dry the transfer case components with compressed air or allow them to air dry on clean shop towels.

Apply compressed air through all oil passages in the cases and gear components to clear them of any residue.

## INSPECTION

## MAINSHAFT

Examine the mainshaft components carefully for evidence of wear or damage.

Replace the thrust washers if worn or damaged.

Replace the mainshaft and sprocket gears if the teeth or gear bores are worn or damaged.

Replace the mainshaft bearings if worn, flat spotted, brinelled, or damaged in any way.

Replace the mainshaft if it is bent, exhibits wear or damage to the bearing surfaces, splines or gear teeth.

## TRANSFER CASE - NV147 (Continued)

**INPUT GEAR**

Check the input gear pilot bearing. Rotate the bearing and check for roughness or noise. Also check bearing position in the bore. The bearing should be installed such that the snap-ring on the outer diameter of the bearing is seated against the front case half. Replace the bearing if worn, or roughness is evident. Replace both the gear and bearing if the bearing is a loose fit in the bore.

During inspection, also make sure the seal surface of the input gear is in good condition. Minor nicks on this surface can be reduced with crocus cloth. However, replace the gear if the seal surface is severely scored or worn.

**GEAR CASE AND RETAINERS**

Examine both case halves and retainers carefully. Replace any retainer or case half if wear, cracks, or other damage is evident.

Check the bushing in the rear retainer. Replace the bushing if worn or scored.

Examine the sealing surfaces of both case halves and retainers. Small burrs, or scratches on these surfaces can be reduced with crocus cloth or a fine tooth file.

**OIL PUMP AND PROGRESSIVE COUPLING**

The oil pump and progressive coupling are not serviceable components. Replace the coupling as an assembly if it is damaged. Replace the oil pump as an assembly if the gear teeth are worn, or if the pump has become damaged.

**BEARINGS AND SEALS**

The transfer case seals should be replaced during overhaul. Use new seals in the input gear bearing retainer, front case and rear retainer. Also replace the yoke seal washer.

Check condition of each transfer case bearing. Replace any bearing exhibiting signs of roughness, wear, or damage.

**ASSEMBLY**

Lubricate transfer case components with Mopar® Transfer Case Lubricant or petroleum jelly (where indicated) during assembly.

**CAUTION:** The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

**BEARINGS AND SEALS**

(1) Remove front output shaft seal from front case with pry tool (Fig. 21).

810c21e6

**Fig. 21 Remove Front Output Shaft Seal**

## TRANSFER CASE - NV147 (Continued)

(3) Using tool 6953, remove bearing from front case (Fig. 23).

(4) Using tool 6953, install new bearing.

**Fig. 23 Remove Output Shaft Front Bearing**

1 - HANDLE C-4171  
2 - REMOVER/INSTALLER 6953

(5) Install snap-ring to hold bearing into case.  
(6) Install new front output seal in front case with Installer Tool 6952-A as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 24). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(7) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 25).

(9) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from inside the front case half.

(10) Position case so forward end is facing upward.

(11) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface.

(12) Remove front bearing retainer seal with suitable pry tool.

(13) Install new front bearing retainer with Installer 7884 (Fig. 28).

J9521-41

**Fig. 28 Install Front Bearing Retainer Seal**

- 1 - FRONT BEARING RETAINER  
2 - SPECIAL TOOL 7884

## TRANSFER CASE - NV147 (Continued)

**INPUT GEAR**

- (1) Align and install input gear into front case.
- (2) Install snap-ring to hold input gear into front bearing (Fig. 29).

**Fig. 29 Install Input Gear Snap-Ring**

- 1 - INPUT GEAR  
2 - SNAP-RING

(3) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(4) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(5) Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION:** Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(6) Install bolts to hold retainer to transfer case (Fig. 30). Tighten to 21 N·m (16 ft. lbs.) of torque.

**MAINSHAFT**

- (1) Install drive sprocket hub to mainshaft and manually load the needle bearings.

**Fig. 30 Install Front Bearing Retainer**

- 1 - FRONT BEARING RETAINER

**FRONT OUTPUT SHAFT AND DRIVE CHAIN**

(1) Lubricate front output shaft-sprocket assembly, drive chain and drive sprocket with transfer case lubricant.

(2) Assemble drive chain, drive sprocket and front output shaft (Fig. 31).

(3) Start drive sprocket on mainshaft.

(4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 31).

810c1ce0

**Fig. 31 Installing Drive Chain, Front Output Shaft And Drive Sprocket**

## TRANSFER CASE - NV147 (Continued)

(5) Install drive sprocket snap-ring (Fig. 32).

**Fig. 32 Installing Drive Sprocket Snap-Ring**

- 1 - MAINSHAFT DRIVE SPROCKET  
2 - DRIVE SPROCKET SNAP-RING  
3 - SNAP-RING PLIERS

- (6) Install roller bearings, if removed.  
(7) Install progressive coupling (Fig. 33).  
(8) Install the progressive coupling thrust washer over the output shaft and against the coupling.  
(9) Install the oil pump locating snap-ring onto the output shaft.

**Fig. 33 Progressive Coupling Installation**

- 1 - SNAP-RING  
2 - PROGRESSIVE COUPLING

(10) Install oil pickup tube in rear case. Be sure tube is seated in case notch as shown (Fig. 34).

**Fig. 34 Oil Pickup Tube Installation**

- 1 - CASE NOTCH  
2 - OIL PICKUP TUBE ASSEMBLY  
3 - CASE SLOT

(11) Install magnet in front case pocket (Fig. 35).

**Fig. 35 Installing Case Magnet**

- 1 - MAGNET

## TRANSFER CASE - NV147 (Continued)

(12) Clean sealing flanges of front case and rear case with a wax and grease remover.

(13) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes as shown (Fig. 36).

810c1e2e

**Fig. 36 Applying Sealer To Front Case Flange**

### COMPANION FLANGE

(1) Install new seal washer on front output shaft (Fig. 40).

(2) Lubricate flange hub with transfer case lubricant and install flange on front shaft.

(3) Install new seal washer on front shaft.

(4) Install companion flange and new nut on front output shaft.

(5) Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold flange while tightening yoke nut.

J9321-2

**Fig. 40 Flange Seal Washer Installation**

**Fig. 43 Rear Bearing Snap-Ring Installation - Typical**

- 1 - REAR BEARING
- 2 - SNAP-RING PLIERS
- 3 - SNAP-RING

- (6) Install rear bearing locating ring in rear retainer, if ring was removed during overhaul.
- (7) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting surface of rear retainer. Allow sealer to set-up slightly before proceeding.
- (8) Slide rear retainer onto mainshaft (Fig. 44).
- (9) Spread rear bearing locating ring and slide rear retainer into place on rear case (Fig. 45).
- (10) Install and tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.).
- (11) Install rubber access plug (Fig. 46).

**Fig. 44 Rear Retainer Installation**

- 1 - REAR CASE
- 2 - REAR RETAINER

## TRANSFER CASE - NV147 (Continued)

**Fig. 45 Engaging Rear Bearing Locating Ring**

- 1 - REAR RETAINER  
2 - PARALLEL JAW SNAP-RING PLIERS

**Fig. 46 Installing Rubber Access Plug**

- 1 - PLUG

**FINAL ASSEMBLY**

- (1) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.) torque.
- (2) Level transfer case and fill it with Mopar® Transfer Case Lubricant. Correct fill level is to bottom edge of fill plug hole.
- (3) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.) torque.

**INSTALLATION**

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case on transmission.
- (5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque.
- (6) Connect front propeller shaft and install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (7) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
- (8) Install rear crossmember (Fig. 47) and skid plate, if equipped. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

**Fig. 47 Crossmember Installation**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

- (9) Remove transmission jack and support stand.
- (10) Lower vehicle and verify transfer case shift operation.

- 2 - FILL PLUG
- 3 - DRAIN PLUG

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® Transfer Case Lubricant.
- (7) Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
- (8) Lower vehicle.

## FRONT OUTPUT SHAFT SEAL

### REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Remove front output shaft companion flange.
- (4) Remove seal from front case with pry tool (Fig. 49).

**Fig. 49 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL  
2 - PRYBAR

### INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 6952-A as follows:
  - (a) Place new seal on tool. Garter spring on seal goes toward interior of case.
  - (b) Start seal in bore with light taps from hammer (Fig. 50). Once seal is started, continue tapping seal into bore until installer tool seats against case.

**Fig. 50 Front Output Seal Installation**

- 1 - INSTALLER 6952-A  
2 - TRANSFER CASE

- (2) Install companion flange and torque nut to 122-176 N·m (90-130 ft. lbs.).

- (3) Install front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

## REAR RETAINER BUSHING AND SEAL

### REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.
- (4) Using Remover 6957, remove bushing from rear retainer (Fig. 51).

80a98373

**Fig. 51 Rear Retainer Bushing Removal**

- 1 - REMOVER 6957  
2 - REAR RETAINER BUSHING

## REAR RETAINER BUSHING AND SEAL (Continued)

**INSTALLATION**

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in retainer.

(3) Using Installer 8145, drive bushing into retainer until installer seats against case (Fig. 52).

(4) Using Installer C-3995-A, install seal in rear retainer (Fig. 53).

(5) Install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper fluid level.

(7) Lower vehicle.

## TRANSFER CASE - NV242

## DESCRIPTION

The NV242 is a full transfer case (Fig. 1). It provides full time 2-wheel, or 4-wheel drive operation.

A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

## TRANSFER CASE IDENTIFICATION

Two versions of the NV242 are used in the WJ vehicles, NV242LD and NV242HD. The two transfer cases can be distinguished from one another by the rear output shaft retainer. The NV242LD uses a rubber boot to cover the rear output shaft, while the NV242HD uses a cast aluminum housing. Other than this difference, the two transfer cases are serviced the same.

J8921-243

**Fig. 1 NV242 Transfer Case**

A circular ID tag is attached to the rear case of each transfer case (Fig. 2). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

## TRANSFER CASE - NV242 (Continued)

**Fig. 2 Fill/Drain Plug And I.D. Tag Locations**

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

### SHIFT MECHANISM

Operating ranges are selected with a lever in the floor mounted shifter assembly. The shift lever is connected to the transfer case range lever by an adjust-

able cable. A straight line shift pattern is used. Range positions are marked on the shifter bezel.

### OPERATION

The input gear is splined to the transmission output shaft. It drives the mainshaft through the planetary gear and range hub. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchro mechanism for shifting.

### OPERATING RANGES

NV242 operating ranges are 2WD (2-wheel drive), 4x4 part-time, 4x4 full time, and 4 Lo.

The 2WD and 4x4 full time ranges can be used at any time and on any road surface.

The 4x4 part-time and 4 Lo ranges are for off road use only. The only time these ranges can be used on hard surface roads, is when the surface is covered with snow and ice.

## DIAGNOSIS AND TESTING - TRANSFER CASE - NV242

### DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case shift linkage binding.	1) Repair or replace linkage as necessary.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct type and quantity of lubricant.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct type and quantity of lubricant.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Transfer case will not shift through 4X4 part time range (light remains on)	1) Incomplete shift due to drivetrain torque load.	1) Momentarily release the accelerator pedal to complete the shift.
	2) Incorrect tire pressure.	2) Correct tire pressure as necessary.
	3) Excessive Tire wear.	3) Correct tire condition as necessary.
	4) Excessive vehicle loading.	4) Correct as necessary.

## TRANSFER CASE - NV242 (Continued)

**REMOVAL**

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove transfer case drain plug and drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember and skid plate, if equipped (Fig. 3).

80ba79c7

**Fig. 3 Crossmember Removal**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

(7) Disconnect front/rear propeller shafts at transfer case. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(8) Disconnect transfer case cable from range lever.

(9) Disconnect transfer case vent hose (Fig. 4) and transfer case position sensor.

(10) Support transfer case with transmission jack.

(11) Secure transfer case to jack with chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Pull transfer case and jack rearward to disengage transfer case.

(14) Remove transfer case from under vehicle.

80ba79c8

**Fig. 4 Transfer Case Mounting**

- 1 - NV242 TRANSFER CASE

**DISASSEMBLY****REAR RETAINER - NV242LD**

(1) Remove output shaft boot. Spread band clamp that secures boot on slinger with a suitable awl. Then slide boot off shaft (Fig. 5).

- 2 - SPECIAL TOOL MD998056-A
- 3 - SLINGER

(3) Remove rear seal from retainer (Fig. 7). Use pry tool, or collapse seal with punch to remove it.

80cc23aa

**Fig. 7 Rear Retainer Seal**

- 1 - REAR RETAINER
- 2 - OUTPUT SHAFT SEAL

(4) Remove rear output bearing I.D. retaining ring (Fig. 8).

80cc2481

**Fig. 8 Output Shaft Rear Bearing Retaining Ring**

- 1 - SNAP-RING PLIERS
- 2 - RETAINING RING

(5) Remove rear retainer bolts.

(6) Remove rear retainer. Tap retainer with mallet and pry upward to break sealer bead. Then slide retainer off case and output shaft (Fig. 9).

80cc2462

**Fig. 9 Rear Retainer Removal**

- 1 - MAINSHAFT
- 2 - REAR RETAINER

## TRANSFER CASE - NV242 (Continued)

**REAR RETAINER - NV242HD**

- (1) Remove extension housing bolts.
- (2) Tap extension housing with plastic or rawhide mallet to loosen sealer (Fig. 10).

**Fig. 10 Remove Extension Housing**

- 1 - EXTENSION HOUSING
- 2 - PLASTIC HAMMER
- 3 - REAR RETAINER

- (3) Separate extension housing from rear retainer.
- (4) Remove rear bearing snap-ring (Fig. 11).

**Fig. 11 Remove the Output Bearing Snap-ring**

- 1 - REAR RETAINER
- 2 - SNAP-RING
- 3 - REAR BEARING

- (5) Remove bolts holding rear retainer to rear case half.

- (6) Loosen rear retainer with pry tool to break sealer bead. Pry only against retainer boss as shown (Fig. 12).

**Fig. 12 Loosening Rear Retainer**

- 1 - REAR RETAINER
- 2 - TAB (2)
- 3 - SCREWDRIVER
- 4 - TAB

- (7) Slide retainer off case and output shaft (Fig. 13).

**Fig. 13 Rear Retainer Removal**

- 1 - MAINSHAFT
- 2 - REAR RETAINER

## TRANSFER CASE - NV242 (Continued)

## OIL PUMP AND REAR CASE HALF

(1) Remove rear bearing O.D. retaining ring with snap ring pliers. Then tilt pump and slide it off output shaft (Fig. 14)

8001096E

**Fig. 14 Oil Pump Removal**

1 - OIL PUMP

(2) Remove pickup tube O-ring from pump (Fig. 15) but do not disassemble pump; it is not a repairable part.

(3) Remove seal from oil pump with pry tool.

RR21F27

**Fig. 15 Pickup Tube O-Ring Location**

1 - OIL PUMP  
2 - O-RING

(4) Remove bolts attaching rear case to front case (Fig. 16). Note position of the two black finish bolts at each end of the case. These bolts go through the case dowels and require a washer under the bolt head.

80b13560

**Fig. 16 Spline And Dowel Bolt Locations**

1 - DOWEL BOLT AND WASHER (2)  
2 - CASE BOLTS  
3 - SPLINE HEAD BOLT (1)

(5) Remove rear case from front case (Fig. 17). Insert screwdrivers into slots cast into each end of case. Then pry upward to break sealer bead and remove rear case.

**CAUTION:** Do not pry on the sealing surface of either case half as the surfaces will become damaged.

80b1358c

**Fig. 17 Loosening/Removing Rear Case**

1 - MAINSHAFT  
2 - SCREWDRIVER  
3 - FRONT CASE  
4 - SCREWDRIVER  
5 - REAR CASE

## TRANSFER CASE - NV242 (Continued)

(6) Remove oil pickup tube and screen from rear case (Fig. 18).

80010979

**Fig. 18 Oil Pickup Screen, Hose And Tube Removal**

- 1 - CONNECTING HOSE
- 2 - PICKUP SCREEN
- 3 - PICKUP TUBE

## COMPANION FLANGE AND RANGE LEVER

(1) Remove transfer case position sensor (Fig. 19).

80ccabc2

**Fig. 19 Remove Transfer Case Position Sensor**

- 1 - TRANSFER CASE POSITION SENSOR
- 2 - TRANSFER CASE

(2) Install two bolts (Fig. 20) partially into the propeller shaft companion flange, 180° from each other.

(3) Install the rectangular end of the Flange Holder C-3281 over the bolts to hold the companion flange stationary and remove the nut holding the companion flange to the output shaft.

(4) Use Remover C-452 (Fig. 21) to remove the companion flange.

80bd68a3

**Fig. 20 Hold Companion Flange - Typical**

- 1 - HOLDER C-3281
- 2 - BOLTS
- 3 - COMPANION FLANGE

80bd68a7

**Fig. 21 Remove Companion Flange - Typical**

- 1 - TRANSFER CASE
- 2 - COMPANION FLANGE
- 3 - REMOVER C-452

## TRANSFER CASE - NV242 (Continued)

(5) Remove seal washer from front output shaft. Discard washer as it should not be reused.

(6) Remove the bolt (Fig. 22) that attaches the range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft.

**NOTE:** Be sure to note the orientation of the range lever (lever up or down) so that it may be re-installed in the same direction.

80ccabcc

**Fig. 22 Remove Shift Lever Bolt - Typical**

- 1 - RANGE LEVER
- 2 - RANGE LEVER BOLT
- 3 - TRANSFER CASE

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove drive sprocket snap-ring (Fig. 23).

80b1359a

**Fig. 23 Drive Sprocket Snap-Ring Removal**

- 1 - DRIVE SPROCKET
- 2 - DRIVE SPROCKET SNAP-RING

(2) Remove drive sprocket and chain (Fig. 24).  
(3) Remove front output shaft (Fig. 25).

80b135a6

**Fig. 24 Drive Sprocket And Chain Removal**

- 1 - DRIVE SPROCKET
- 2 - DRIVE CHAIN

80b136a2

**Fig. 25 Removing Front Output Shaft**

- 1 - FRONT OUTPUT SHAFT

## TRANSFER CASE - NV242 (Continued)

## SHIFT FORKS AND MAINSHAFT

(1) Remove shift detent plug, spring and pin (Fig. 26).

**Fig. 26 Detent Component Removal**

- 1 - PLUNGER
- 2 - O-RING
- 3 - PLUG
- 4 - SPRING

(2) Remove seal plug from low range fork lockpin access hole. Then move shift sector to align low range fork lockpin with access hole.

(3) Remove range fork lockpin with size number one easy-out tool as follows:

(a) Insert easy-out tool through access hole in side of transfer case and into lock-pin.

(b) Tap easy-out tool into lock-pin with hammer until tool is securely engaged into the lock-pin.

(c) Install a t-handle, such as from a tap and die set, onto the easy-out tool.

(d) Securely tighten the t-handle onto the tool.

(e) In one motion, pull upward and turn the t-handle counter-clockwise to remove the lock-pin.

(4) Remove shift rail by pulling it straight up and out of fork (Fig. 27).

(5) Remove mode fork and mainshaft as assembly (Fig. 28).

80b135b4

**Fig. 27 Shift Rail Removal**

- 1 - SHIFT RAIL
- 2 - MODE FORK

80b135e0

**Fig. 28 Mainshaft And Mode Fork Removal**

- 1 - MAINSHAFT ASSEMBLY
- 2 - MODE FORK

## TRANSFER CASE - NV242 (Continued)

(6) Remove mode shift sleeve and mode fork assembly from mainshaft (Fig. 29). Note position of mode sleeve in fork and remove sleeve.

**Fig. 29 Separate Mode Fork And Sleeve**

- 1 - MAINSHAFT
- 2 - MODE SLEEVE
- 3 - MODE FORK ASSEMBLY

(7) Remove intermediate clutch shaft snap-ring (Fig. 30).

(8) Remove clutch shaft thrust ring (Fig. 31).

**Fig. 30 Intermediate Clutch Shaft Snap-Ring Removal**

- 1 - SNAP-RING
- 2 - INTERMEDIATE CLUTCH SHAFT

**Fig. 31 Clutch Shaft Thrust Ring Removal**

- 1 - CLUTCH SHAFT THRUST RING

## TRANSFER CASE - NV242 (Continued)

(9) Remove intermediate clutch shaft (Fig. 32).

**Fig. 32 Intermediate Clutch Shaft Removal**

1 - INTERMEDIATE CLUTCH SHAFT

- (10) Remove differential snap-ring (Fig. 33).  
 (11) Remove differential (Fig. 34).  
 (12) Remove differential needle bearings and both needle bearing thrust washers from mainshaft.

**Fig. 33 Differential Snap-Ring Removal**

1 - DIFFERENTIAL SNAP-RING

**Fig. 34 Differential Removal**

1 - DIFFERENTIAL  
 2 - MAINSHAFT

- (13) Slide low range fork pin out of shift sector slot.  
 (14) Remove low range fork and sleeve (Fig. 35).  
 (15) Remove shift sector.

**Fig. 35 Low Range Fork And Hub Removal**

1 - LOW RANGE FORK  
 2 - FORK HUB

## TRANSFER CASE - NV242 (Continued)

(16) Remove the shift sector shaft bushing and o-ring (Fig. 36).

80ab5050

**Fig. 36 Remove the Shift Sector O-Ring**

- 1 - TRANSFER CASE FRONT HOUSING  
2 - SHIFT SECTOR O-RING

## INPUT GEAR/LOW RANGE ASSEMBLY

- (1) Remove front bearing retainer bolts.
- (2) Remove front bearing retainer. Carefully pry retainer loose with screwdriver (Fig. 37). Position screwdriver in slots cast into retainer.
- (3) Remove input gear snap-ring (Fig. 38).

J8921-266

**Fig. 37 Front Bearing Retainer Removal**

- 1 - FRONT BEARING RETAINER  
2 - RETAINER SLOT

J8921-267

**Fig. 38 Input Gear Snap Ring Removal**

- 1 - INPUT GEAR  
2 - SNAP-RING

(4) Remove input/low range gear assembly from bearing with Tool Handle C-4171 and Tool 7829A (Fig. 39).

J9521-46

**Fig. 39 Input And Low Range Gear Assembly Removal**

- 1 - INPUT-LOW RANGE GEARS  
2 - SPECIAL TOOL 7829-A  
3 - SPECIAL TOOL C-4171

## TRANSFER CASE - NV242 (Continued)

- (5) Remove low range gear snap-ring (Fig. 40).  
 (6) Remove input gear retainer, thrust washers and input gear from low range gear (Fig. 41).

**Fig. 40 Remove Low Range Gear Snap-Ring**

1 - LOW RANGE GEAR SNAP-RING

**Fig. 41 Low Range And Input Gear Assembly**

1 - THRUST WASHERS  
 2 - LOW RANGE GEAR  
 3 - INPUT GEAR  
 4 - RETAINER

- (7) Inspect low range annulus gear (Fig. 42). **Gear is not a serviceable component. If damaged, replace gear and front case as assembly.**

- (8) Remove oil seals from following components:

- front bearing retainer.
- rear retainer.
- oil pump.
- case halves.

**Fig. 42 Inspecting Low Range Annulus Gear**

1 - LOW RANGE ANNULUS GEAR

## DIFFERENTIAL

- (1) Mark differential case halves for reference.  
 (2) Remove differential case bolts.  
 (3) Invert differential on workbench.  
 (4) Separate top case from bottom case. Use slots in case halves to pry them apart (Fig. 43).

**Fig. 43 Separating Differential Case Halves**

1 - TOP CASE  
 2 - CASE BOLTS  
 3 - CASE BOLTS  
 4 - CASE SLOTS  
 5 - CASE BOLTS

## TRANSFER CASE - NV242 (Continued)

(5) Remove thrust washers and planet gears from case pins (Fig. 44).

(6) Remove mainshaft and sprocket gears from bottom case (Fig. 45). Note gear position for reference before separating them.

**Fig. 44 Planet Gears And Thrust Washer Removal**

- 1 - MAINSHAFT GEAR
- 2 - THRUST WASHERS (12)
- 3 - PLANET GEARS (6)

## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

**Fig. 45 Mainshaft And Sprocket Gear Removal**

- 1 - MAINSHAFT GEAR
- 2 - SPROCKET GEAR
- 3 - BOTTOM CASE

## INSPECTION

### MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

## TRANSFER CASE - NV242 (Continued)

**INPUT GEAR AND PLANETARY CARRIER**

Check the teeth on the gear (Fig. 46). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

**SHIFT FORKS/HUBS/SLEEVES**

Check condition of the shift forks and mode fork shift rail (Fig. 47). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads. The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are also serviceable.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

80cfe528

**Fig. 47 Shift Fork And Wear Pad Locations**

- 4 - CARRIER LOCK RING
- 5 - CARRIER LOCK RETAINING RING
- 6 - INPUT GEAR

## TRANSFER CASE - NV242 (Continued)

**REAR RETAINER/BEARING/ SEAL/SLINGER/BOOT**

Inspect the retainer components (Fig. 48). Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Replace the slinger and seal outright; do not reuse either part.

Replace any part if distorted, bent, or broken. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

**REAR OUTPUT SHAFT/YOKE/DRIVE CHAIN**

Check condition of the seal contact surfaces of the yoke slinger (Fig. 49). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

80c070f4

**Fig. 48 Rear Retainer - Typical**

- 1 - REAR RETAINER
- 2 - REAR BEARING I.D. MAINSHAFT RETAINING RING
- 3 - REAR SEAL
- 4 - BOOT

- 5 - BAND CLAMPS
- 6 - REAR SLINGER
- 7 - REAR BEARING O.D. RETAINING RING
- 8 - REAR BEARING

## TRANSFER CASE - NV242 (Continued)

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

**Fig. 49 Seal Contact Surface Of Yoke Slinger**

- 1 - FRONT SLINGER (PART OF YOKE)
- 2 - SEAL CONTACT SURFACE MUST BE CLEAN AND SMOOTH

**LOW RANGE ANNULUS GEAR**

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 50)

**Fig. 50 Low Range Annulus Gear**

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

**FRONT-REAR CASES AND FRONT RETAINER**

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

**OIL PUMP/OIL PICKUP**

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

**ASSEMBLY**

Lubricate transfer case components with automatic transmission fluid or petroleum jelly (where indicated) during assembly.

**CAUTION:** The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

## TRANSFER CASE - NV242 (Continued)

**BEARING AND SEAL**

(1) Remove snap-ring that retains front output shaft front bearing in case (Fig. 51). Then remove bearing. Use hammer handle, or hammer and brass punch to tap bearing out of case.

(2) Install new front output shaft front bearing with Tool Handle C-4171 and Installer 8033-A with the tapered cone upward (Fig. 52).

**Fig. 51 Front Output Shaft Front Bearing Snap-Ring Removal**

1 - FRONT BEARING SNAP-RING

**Fig. 52 Front Output Shaft Front Bearing Installation**

1 - SPECIAL TOOL C-4171  
2 - SPECIAL TOOL 8033-A

(3) Install front bearing snap-ring (Fig. 51).

(4) Remove front output shaft seal using an appropriate pry tool (Fig. 53) or slide-hammer mounted screw.

(5) Install new front output shaft oil seal with Installer 6952-A (Fig. 54).

**Fig. 53 Remove Front Output Shaft Seal**

1 - OUTPUT SHAFT SEAL  
2 - PRYBAR

**Fig. 54 Install Front Output Shaft Seal**

3 - REAR RETAINER

## DIFFERENTIAL

(1) Lubricate differential components with automatic transmission fluid.

(2) Install sprocket gear in differential bottom case (Fig. 65).

J8921-279

**Fig. 65 Installing Differential Sprocket Gear**

1 - SPROCKET GEAR  
2 - BOTTOM CASE

(3) Install differential planet gears and new thrust washers (Fig. 66). **Be sure thrust washers are installed at top and bottom of each planet gear.**

(4) Install differential mainshaft gear (Fig. 66).

(5) Align and position differential top case on bottom case (Fig. 67). Align using scribe marks made at disassembly.

(6) While holding differential case halves together, invert the differential and start the differential case bolts.

(7) Tighten differential case bolts to specified torque.

## TRANSFER CASE - NV242 (Continued)

- 3 - CASE ALIGNMENT MARKS

**INPUT GEAR/LOW RANGE ASSEMBLY**

- (1) Assemble low range gear, input gear thrust washers, input gear and input gear retainer (Fig. 68).
- (2) Install low range gear snap ring (Fig. 69).

**Fig. 68 Low Range And Input Gear Assembly**

- 1 - THRUST WASHERS
- 2 - LOW RANGE GEAR
- 3 - INPUT GEAR
- 4 - RETAINER

**Fig. 69 Install Low Range Gear Snap-Ring**

- 1 - LOW RANGE GEAR SNAP-RING

## TRANSFER CASE - NV242 (Continued)

- (3) Lubricate input gear and low range gears with automatic transmission fluid.
- (4) Start input gear shaft into front case bearing.
- (5) Press input gear shaft into front bearing.
- (6) Install new input gear snap ring (Fig. 70).

J8921-267

**Fig. 70 Input Gear Snap-Ring Installation**

- 1 - INPUT GEAR
- 2 - SNAP-RING

(7) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front bearing retainer.

(8) Install front bearing retainer (Fig. 71). Tighten retainer bolts to 16 ft. lbs. (21 N·m) torque.

J8921-276

**Fig. 71 Installing Front Bearing Retainer**

- 1 - FRONT BEARING RETAINER

**SHIFT FORKS, SECTOR, AND MAINSHAFT**

- (1) Install the shift sector shaft o-ring and bushing.
- (2) Install shift sector.
- (3) Install new pads on low range fork, if necessary.
- (4) Assemble low range fork and sleeve.
- (5) Position low range fork and sleeve in case. Be sure low range fork pin is engaged in shift sector slot.
- (6) Install first mainshaft bearing spacer on mainshaft (Fig. 72).
- (7) Install bearing rollers on mainshaft (Fig. 72). Coat bearing rollers with generous quantity of petroleum jelly to hold them in place.
- (8) Install remaining bearing spacer on mainshaft (Fig. 72). Do not displace any bearings while installing spacer.

**Fig. 72 Installing Mainshaft Bearing Rollers and Spacers**

- 1 - MAINSHAFT BEARING ROLLERS
- 2 - BEARING SPACERS

## TRANSFER CASE - NV242 (Continued)

- (9) Install differential (Fig. 73). Do not displace mainshaft bearings when installing differential.  
 (10) Install differential snap-ring (Fig. 74).  
 (11) Install intermediate clutch shaft (Fig. 75).

**Fig. 73 Differential Installation**

- 1 - DIFFERENTIAL  
 2 - MAINSHAFT

**Fig. 75 Installing Intermediate Clutch Shaft**

- 1 - INTERMEDIATE CLUTCH SHAFT

- (12) Install clutch shaft thrust washer (Fig. 76).

- 2 - ACCESS HOLE
- 3 - EASY-OUT

## TRANSFER CASE - NV242 (Continued)

- (22) Install plug in lockpin access hole.  
 (23) Install detent plunger, detent spring and detent plug in case (Fig. 83).

**Fig. 83 Detent Pin, Spring And Plug Installation**

- 1 - PLUNGER  
 2 - O-RING  
 3 - PLUG  
 4 - SPRING

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Install front output shaft (Fig. 84).  
 (2) Install drive chain (Fig. 84). Engage chain with front output shaft sprocket teeth.  
 (3) Install drive sprocket (Fig. 84). Engage drive sprocket teeth with chain. Then engage sprocket splines with mainshaft splines.

**Fig. 84 Drive Chain And Sprocket Installation**

- 1 - DRIVE SPROCKET  
 2 - DRIVE CHAIN

- (4) Install drive sprocket snap-ring (Fig. 85).

**Fig. 85 Drive Sprocket Snap-Ring Installation**

- 1 - DRIVE SPROCKET  
 2 - DRIVE SPROCKET SNAP-RING

## OIL PUMP AND REAR CASE

- (1) Insert oil pickup tube in oil pump and attach oil screen and connector hose to pickup tube. Then install assembled pump, tube and screen in rear case (Fig. 86). Be sure screen is seated in case slot as shown.

**Fig. 86 Oil Screen And Pickup Tube Installation**

- 1 - OIL PUMP  
 2 - OIL SCREEN  
 3 - CONNECTOR  
 4 - PICKUP TUBE

## TRANSFER CASE - NV242 (Continued)

- (2) Install magnet in front case pocket (Fig. 87).

J8921-288

**Fig. 87 Installing Case Magnet**

1 - MAGNET

- (3) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front case.

- (4) Align and install rear case on front case. Be sure case locating dowels are in place and that main-shaft splines are engaged in oil pump inner gear.

- (5) Install and tighten front case-to-rear case bolts to 41 N·m (30 ft. lbs.) torque. **Be sure to install a washer under each bolt used at case dowel locations.**

**REAR RETAINER - NV242LD**

- (1) Apply bead of Mopar® Sealer, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.

- (2) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

- (3) Install rear bearing I.D. retaining ring and spacer on output shaft.

- (4) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

- (5) Slide seal onto Seal Protector 6992 (Fig. 88). Slide seal protector and seal onto output shaft.

- (6) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 89).

- (7) Install rear slinger with Installer 8408.

- (8) Install boot on output shaft slinger and crimp retaining clamp with tool C-4975-A (Fig. 90).

80a50355

**Fig. 88 Output Shaft Seal and Protector**

- 3 - BOOT
- 4 - CLAMP

**NV242HD REAR RETAINER**

(1) Apply bead of Mopar® Sealer, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.

(2) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(3) Install new output shaft bearing snap-ring (Fig. 91). Lift mainshaft slightly to seat snap-ring in shaft groove, if necessary.

(4) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting surface of extension housing. Allow sealer to set-up slightly before proceeding.

(5) Install extension housing on rear retainer.

(6) Install extension housing bolts and tighten to 35-46 N·m (26-34 ft. lbs.).

**COMPANION FLANGE**

(1) Lubricate companion flange hub with transmission fluid and install flange on front shaft.

(2) Install new seal washer on front shaft.

(3) Install flange on front shaft and tighten nut to 122-176 N·m (90-130 ft. lbs.).

**Fig. 91 Install Output Bearing Snap-ring**

- 1 - REAR RETAINER
- 2 - SNAP-RING
- 3 - REAR BEARING

**INSTALLATION**

(1) Mount transfer case on a transmission jack.

(2) Secure transfer case to jack with chains.

(3) Position transfer case under vehicle.

(4) Align transfer case and transmission shafts and install transfer case on transmission.

(5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 4).

(6) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(7) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

(8) Install rear crossmember and skid plate, if equipped. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

(9) Remove transmission jack and support stand.

(10) Connect shift rod to transfer case range lever.

(11) Connect transfer case vent hose and transfer case position sensor.

(12) Adjust transfer case shift cable.

(13) Lower vehicle and verify transfer case shift operation.

## FLUID

### STANDARD PROCEDURE - FLUID DRAIN/REFILL

The fill and drain plugs are both in the rear case (Fig. 92).

**Fig. 92 Fill/Drain Plug and I.D. Tag Location - Typical**

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® Transfer Case Lubricant.
- (7) Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
- (8) Lower vehicle.

## FRONT OUTPUT SHAFT SEAL

### REMOVAL

- (1) Raise vehicle.
- (2) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Remove front output shaft companion flange.
- (4) Remove seal from front case with pry tool (Fig. 93).

### INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 6952-A as follows:

**Fig. 93 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL
- 2 - PRYBAR

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 94). Once seal is started, continue tapping seal into bore until installer tool seats against case.

**Fig. 94 Front Output Seal Installation**

- 1 - INSTALLER 6952-A
- 2 - TRANSFER CASE

(2) Install companion flange and tighten nut to 122-176 (90-130 ft. lbs.) torque.

(3) Install front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

## POSITION SENSOR

### DESCRIPTION

The transfer case position sensor (Fig. 95) is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

### OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position (Fig. 96).

80cc20be

**Fig. 95 Transfer Case Position Sensor and Connector**

- 1 - TRANSFER CASE POSITION SENSOR CONNECTOR
- 2 - TRANSFER CASE POSITION SENSOR
- 3 - TRANSFER CASE
- 4 - OUTPUT SPEED SENSOR CONNECTOR

### OPERATING MODE VERSUS RESISTANCE

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2WD	1124-1243
2	4WD PART TIME	650-719
3	4WD FULL TIME	389-431
4	NEUTRAL	199-221
5	4WD LOW	57-64

- 4 - POSITION 4 - 16mm ±0.5mm
- 5 - POSITION 5 - 18mm ±0.5mm
- 6 - POSITION 6 - 20mm±0.5mm - FULL EXTENSION

## POSITION SENSOR (Continued)

## REMOVAL

- (1) Raise and support the vehicle.
- (2) Disengage the transfer case position sensor connector from the position sensor (Fig. 97).
- (3) Remove the position sensor from the transfer case.

80cc20be

**Fig. 97 Transfer Case Position Sensor and Connector**

- 1 - TRANSFER CASE POSITION SENSOR CONNECTOR
- 2 - TRANSFER CASE POSITION SENSOR
- 3 - TRANSFER CASE
- 4 - OUTPUT SPEED SENSOR CONNECTOR

## INSTALLATION

- (1) Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
- (2) Install the transfer case position sensor into the transfer case. Torque the sensor to 20-34 N·m (15-25 ft.lbs.).
- (3) Engage the transfer case position sensor connector to the position sensor.
- (4) Lower vehicle.
- (5) Verify proper sensor operation.

## REAR RETAINER BUSHING AND SEAL - NV242HD

## REMOVAL

- (1) Raise vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.
- (4) Using Remover 6957, remove bushing from rear retainer (Fig. 98).

80a98373

**Fig. 98 Rear Retainer Bushing Removal**

- 1 - REMOVER 6957
- 2 - REAR RETAINER BUSHING

## INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in retainer.
- (3) Using Installer 8160, drive bushing into retainer until installer seats against case (Fig. 99).

80a9b39f

**Fig. 99 Rear Retainer Bushing Install**

- 1 - REAR RETAINER BUSHING

## REAR RETAINER BUSHING AND SEAL - NV242HD (Continued)

(4) Using Installer C-3995-A, install seal in rear retainer (Fig. 100).

80a983a7

**Fig. 100 Install Rear Retainer Seal**

- 1 - SPECIAL TOOL C-4171  
2 - SPECIAL TOOL C-3995-A

(5) Install the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper fluid level.

(7) Lower vehicle.

## SHIFT CABLE

## REMOVAL

- (1) Shift transfer case into NEUTRAL.  
(2) Raise vehicle.  
(3) Disconnect the shift cable eyelet from the transfer case shift lever (Fig. 101).  
(4) Remove shift cable from the cable support bracket.

80ba79c6

**Fig. 101 Transfer Case Shift Cable at Transfer Case**

- 1 - TRANSFER CASE SHIFT LEVER  
2 - TRANSFER CASE SHIFT CABLE

(5) Lower vehicle.

(6) Remove any necessary console parts for access to shift lever assembly and shift cable.

(7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 102).

(8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 103).

(9) Pull cable through floor panel opening.

80ba79cd

**Fig. 102 Transfer Case Shift Cable at Shifter**

- 1 - CLIP

3 - TRANSFER CASE SHIFT LEVER PIN  
4 - TRANSFER CASE SHIFT CABLE

80ba79cc

**Fig. 103 Shift Cables at Floor Pan**

- 1 - SEAL PLATES  
2 - TRANSMISSION SHIFT CABLE  
3 - TRANSFER CASE SHIFT CABLE

(10) Remove transfer case shift cable from vehicle.

## INSTALLATION

- (1) Route cable through hole in floor pan.  
(2) Install seal plate to studs in floor pan.  
(3) Install nuts to hold seal plate to floor pan (Fig. 103). Tighten nuts to 7 N·m (65 in.lbs.).

## SHIFT CABLE (Continued)

(4) Install the transfer case shift cable to the shifter assembly bracket. Seat cable in bracket and install clip (Fig. 102).

(5) Verify the transfer case shift lever (at console) is in the NEUTRAL position.

(6) Snap the cable onto the shift lever pin (Fig. 102).

(7) Raise the vehicle.

(8) Install the shift cable to the shift cable support bracket and install clip (Fig. 101).

(9) Verify that the transfer case is still in the NEUTRAL position.

(10) Snap the shift cable onto the transfer case shift lever (Fig. 101).

(11) Lower vehicle.

(12) Verify correct transfer case operation in all ranges.

(13) Install any console parts removed for access to transfer case shift cable.

## TRANSFER CASE - NV247

### DESCRIPTION

The NV247 (Fig. 1) is an on-demand 4-wheel drive transfer case with two operating ranges and a neutral position. Operating ranges are 4-high and 4-low. The 4-low range is used for extra pulling power in off-road situations.

80ba7a31

**Fig. 1 NV247 Transfer Case**

### TRANSFER CASE IDENTIFICATION

A circular I.D. tag is attached to the rear case of each NV247 transfer case (Fig. 2). The tag indicates the following information:

- Model number
- Serial number
- Assembly number
- Gear ratio
- Location of manufacture

The transfer case serial number also represents the date of build.

80ba7a32

**Fig. 2 Transfer Case I.D. Tag**

- 1 - FILL PLUG
- 2 - I.D. TAG
- 3 - DRAIN PLUG

## TRANSFER CASE - NV247 (Continued)

**OPERATION**

Under normal driving conditions, the system operates conventionally, and the majority of available torque is applied to the rear wheels. However, when front-to-rear wheel speed variations exist, the progressive differential transfers torque to the axle with the better traction, thus minimizing wheel spin and maximizing control.

The key to this design is a progressive coupling (Fig. 3), which is supplied with pressurized oil by a gerotor style pump. The pump rotor and case are driven by the front and rear driveshafts respectively, and deliver pressurized oil flow to the coupling in proportion to their speed difference. The progressive coupling contains a multi-disc clutch pack that is alternately splined to the front and rear driveshafts, and controls torque variation between the front and rear driveshafts as dictated by the pump.

A set of orifices and valves control the speed-differential starting point and rate of torque transfer rise in the clutch. This allows the system to disregard the normal speed differences between axles that result from variations in front-to-rear loading and typical cornering.

Transfer case operating ranges are selected with a floor mounted shift lever. The shift lever is connected

to the transfer case range lever by an adjustable cable. Range positions are marked on the shifter bezel plate.

80ba7a55

**Fig. 3 Progressive Coupling****DIAGNOSIS AND TESTING - TRANSFER CASE - NV247**

CONDITION	POSSIBLE CAUSE	CORRECTION
TRANSFER CASE DIFFICULT TO SHIFT OR WILL NOT SHIFT INTO DESIRED RANGE	1. Vehicle speed too great to permit shifting	1. Reduce speed to 3-4 km/h (2-3 mph) before attempting to shift
	2. Transfer case external shift cable binding	2. Lubricate, repair or replace cable, or tighten loose components as necessary
	3. Insufficient or incorrect lubricant	3. Drain and refill to edge of fill hole with correct lubricant
	4. Internal components binding, worn, or damaged	4. Disassemble unit and replace worn or damaged components as necessary
TRANSFER CASE NOISY IN ALL MODES	1. Insufficient or incorrect lubricant	1. Drain and refill to edge of fill hole with correct lubricant. <b>If unit is still noisy after drain and refill, disassembly and inspection may be required to locate source of noise</b>

## TRANSFER CASE - NV247 (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
NOISY IN—OR JUMPS OUT OF 4WD LOW RANGE	1. Transfer case not completely engaged in 4WD LOW (possibly from shift to 4L while rolling)	1. Stop vehicle, shift transfer case to neutral, then shift back to 4WD LOW
	2. Shift linkage loose, binding, or is misadjusted	2. Tighten, lubricate, or repair linkage as necessary. Adjust linkage if necessary
	3. Range fork cracked, inserts worn, or fork is binding on shift rail	3. Disassemble unit and repair as necessary
	4. Annulus gear or lockplate worn or damaged	4. Disassemble unit and repair as necessary
LUBRICANT LEAKING FROM OUTPUT SHAFT SEALS OR FROM VENT	1. Transfer case over filled	1. Drain to correct level
	2. Vent closed or restricted	2. Clear or replace vent if necessary
	3. Output shaft seals damaged or installed correctly	3. Replace seals. Be sure seal lip faces interior of case when installed. Also be sure yoke seal surfaces are not scored or nicked. Remove scores and nicks with fine sandpaper or replace yoke(s) if necessary.

**REMOVAL**

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove transfer case drain plug and drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember and skid plate, if equipped (Fig. 4).
- (7) Disconnect front propeller shaft from transfer case at companion flange. Remove rear propeller shaft from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

**CAUTION:** Do not allow propshafts to hang at attached end. Damage to joint can result.

- (8) Disconnect transfer case cable from range lever.
- (9) Disconnect transfer case vent hose (Fig. 5).
- (10) Support transfer case with transmission jack.
- (11) Secure transfer case to jack with chains.
- (12) Remove nuts attaching transfer case to transmission.

80ba79c7

**Fig. 4 Crossmember Removal**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

## TRANSFER CASE - NV247 (Continued)

(13) Pull transfer case and jack rearward to disengage transfer case (Fig. 5).

(14) Remove transfer case from under vehicle.

80ba79c9

**Fig. 5 Transfer Case Mounting**

1 - NV247 TRANSFER CASE

## DISASSEMBLY

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

## REAR RETAINER AND OIL PUMP

(1) Remove rear retainer bolts (Fig. 6).

(2) Remove rear bearing locating ring access plug (Fig. 7).

80ba7a35

**Fig. 6 Rear Retainer Bolt Removal**

1 - REAR RETAINER

80ba7a33

**Fig. 7 Remove Rubber Access Plug**

1 - PLUG

(3) Loosen rear retainer with pry tool to break sealer bead. Pry only against retainer boss as shown (Fig. 8).

80ba7a34

**Fig. 8 Loosening Rear Retainer**

1 - RETAINER BOSS  
2 - PRY TOOL  
3 - SEALER BEAD  
4 - REAR RETAINER

## TRANSFER CASE - NV247 (Continued)

(4) Remove rear retainer as follows:

(a) Spread rear bearing locating ring with snap ring pliers (Fig. 9).

(b) Then slide retainer off mainshaft and rear bearing (Fig. 10).

**Fig. 9 Disengaging Rear Bearing Locating Ring**

- 1 - REAR RETAINER  
2 - PARALLEL JAW SNAP-RING PLIERS

**Fig. 10 Rear Retainer Removal**

- 1 - REAR CASE  
2 - REAR RETAINER

(5) Remove rear bearing snap-ring.

(6) Remove rear bearing. Note position of bearing locating ring groove for assembly reference.

(7) Disengage oil pickup tube from oil pump and remove oil pump assembly (Fig. 11).

(8) Remove pick-up tube o-ring from oil pump (Fig. 12), if necessary. Do not disassemble the oil pump, it is not serviceable.

80ba7a38

**Fig. 11 Rear Bearing and Oil Pump Removal**

- 1 - OIL PUMP  
2 - TUBE O-RING  
3 - OIL PICKUP TUBE

80ba7a39

**Fig. 12 Pick-up Tube O-ring Location**

- 1 - OIL PUMP  
2 - O-RING

## COMPANION FLANGE AND RANGE LEVER

(1) Remove front companion flange nut as follows:

(a) Move range lever to 4L position.

(b) Remove nut with socket and impact wrench.

(2) Remove companion flange. If flange is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller. Be sure puller tool is positioned on flange and not on slinger as slinger will be damaged.

(3) Remove seal washer from front output shaft. Discard washer as it should not be reused.

(4) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft.

**NOTE:** Note position of range lever so it can be re-installed correctly.

## TRANSFER CASE - NV247 (Continued)

**REAR CASE**

(1) Support transfer case so rear case is facing upward.

(2) Remove bolts holding front case to rear case. The case alignment bolt require flat washers (Fig. 13).

(3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert screwdriver blade only into notches provided at each end of case (Fig. 14).

(4) Remove rear case (Fig. 15).

**Fig. 13 Rear Case Alignment Bolt Locations**

1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

**PROGRESSIVE COUPLING**

(1) Remove oil pump locating snap-ring and progressive coupling thrust washer from the mainshaft (Fig. 16).

(2) Remove progressive coupling from mainshaft (Fig. 16).

**Fig. 16 Progressive Coupling Removal**

1 - SNAP-RING  
2 - PROGRESSIVE COUPLING

## TRANSFER CASE - NV247 (Continued)

**FRONT OUTPUT SHAFT AND DRIVE CHAIN**

- (1) Remove oil pickup tube from rear case (Fig. 17).
- (2) Remove drive gear snap-ring (Fig. 18).
- (3) Disengage drive gear (Fig. 18). Pry gear upward and off mainshaft as shown.
- (4) Remove front output shaft, drive chain and drive gear as assembly (Fig. 18).
- (5) Remove output shaft drive gear snap ring.
- (6) Remove output shaft drive gear from output shaft.

**Fig. 17 Oil Pickup Tube Removal**

1 - OIL PICKUP TUBE

**Fig. 18 Front Output Shaft, Drive Gear And Chain Removal**

- 1 - REAR HOUSING
- 2 - OUTPUT SHAFT AND SPROCKET
- 3 - MAINSHAFT SPROCKET
- 4 - SNAP-RING
- 5 - DRIVE CHAIN

**SHIFT FORKS AND MAINSHAFT**

- (1) Remove detent plug, O-ring, detent spring and detent plunger (Fig. 19).

**Fig. 19 Detent Plug, Spring And Plunger Removal**

- 1 - DETENT PLUG
- 2 - DETENT SPRING
- 3 - DETENT PLUNGER
- 4 - PLUG O-RING

- (2) Remove shift rail from shift fork and transfer case housing.
- (3) Rotate range shift fork until it disengages from shift sector.
- (4) Remove mainshaft and shift fork from input gear pilot bearing.

**NOTE:** Loose needle bearings are used to support the drive sprocket hub on the mainshaft. Do not lift mainshaft by drive sprocket hub or needle bearings will become dislodged.

- (5) Wrap rag around mainshaft underneath drive sprocket hub and remove drive sprocket hub from mainshaft. Be sure to retrieve all the drive sprocket hub needle bearings.

- (6) Remove snap ring holding clutch sleeve onto mainshaft.

## TRANSFER CASE - NV247 (Continued)

(7) Remove range clutch sleeve, blockout spring, locking clutch, and locking clutch spring from main-shaft (Fig. 20).

80ba7a52

**Fig. 20 Range Clutch Sleeve, Blockout Spring, Locking Clutch and Spring**

- 2 - BLOCKOUT SPRING
- 3 - SNAP-RING
- 4 - RANGE CLUTCH SLEEVE
- 5 - LOCKING CLUTCH
- 6 - DRIVE SPROCKET HUB

(8) Remove shift sector. Rotate and tilt sector as needed to remove it (Fig. 21).

(9) Remove shift sector bushing and O-ring (Fig. 22).

J9321-31

**Fig. 21 Shift Sector Removal**

- 1 - SHIFT SECTOR

J8921-207

**Fig. 22 Sector Bushing And O-Ring Removal**

- 1 - SHIFT SECTOR BUSHING
- 2 - O-RING

### INPUT GEAR/LOW RANGE ASSEMBLY

(1) Turn front case on side so front bearing retainer is accessible.

(2) Remove front bearing retainer bolts (Fig. 23).

(3) Remove front bearing retainer as follows:

(a) Loosen retainer with flat blade screwdriver to break sealer bead. **To avoid damaging case and retainer, position screwdriver blade only in slots provided in retainer (Fig. 24).**

(b) Then remove retainer from case and gear.

J9321-26

**Fig. 23 Front Bearing Retainer Bolt Removal**

- 1 - FRONT BEARING RETAINER

## TRANSFER CASE - NV247 (Continued)

**Fig. 24 Front Bearing Retainer Removal**

- 1 - FRONT BEARING RETAINER  
 2 - RETAINER NOTCH  
 3 - FLAT BLADE SCREWDRIVER

(4) Remove snap-ring that retains input gear shaft in front bearing (Fig. 25).

(5) Remove input and low range gear assembly (Fig. 26).

**Fig. 25 Input Gear Snap-Ring Removal**

- 1 - INPUT GEAR  
 2 - SNAP-RING

(6) Remove oil seals from following components:

- front bearing retainer.
- rear retainer.
- case halves.

**Fig. 26 Input And Low Range Gear Assembly Removal**

- 1 - INPUT AND LOW RANGE GEAR ASSEMBLY

**INPUT AND LOW RANGE GEAR**

(1) Remove snap-ring that retains input gear in low range gear (Fig. 27).

**Fig. 27 Input Gear Snap-Ring Removal**

- 1 - INPUT GEAR SNAP-RING

## TRANSFER CASE - NV247 (Continued)

- (2) Remove retainer (Fig. 28).
- (3) Remove front tabbed thrust washer (Fig. 29).
- (4) Remove input gear (Fig. 30).
- (5) Remove rear tabbed thrust washer from low range gear (Fig. 31).

**Fig. 28 Input Gear Retainer**

- 1 - INPUT GEAR
- 2 - LOW RANGE GEAR
- 3 - RETAINER

**Fig. 29 Front Tabbed Thrust Washer**

- 1 - FRONT TABBED THRUST WASHER

**CLEANING**

Clean the transfer case components with parts cleaning solvent. Flush the oil passages in the cases and drivetrain components with solvent. This will help remove dirt and particles from these passages.

Dry the transfer case components with compressed air or allow them to air dry on clean shop towels.

Apply compressed air through all oil passages in the cases and gear components to clear them of any residue.

**Fig. 30 Input Gear Removal**

- 1 - INPUT GEAR
- 2 - LOW RANGE GEAR

**Fig. 31 Rear Tabbed Thrust Washer Removal**

- 1 - LOW RANGE GEAR
- 2 - REAR TABBED THRUST WASHER

**INSPECTION****MAINSHAFT**

Examine the mainshaft components carefully for evidence of wear or damage.

Replace the thrust washers if worn or damaged.

Replace the mainshaft and sprocket gears if the teeth or gear bores are worn or damaged.

Replace the mainshaft bearings if worn, flat spotted, brinelled, or damaged in any way.

Replace the mainshaft if it is bent, exhibits wear or damage to the bearing surfaces, splines or gear teeth.

**INPUT AND LOW RANGE GEARS**

Inspect the low range gear pinions and pinion pins. Replace the low range gear if any of the pins or pinions are worn or damaged.

## TRANSFER CASE - NV247 (Continued)

Inspect the thrust washers, retainer, and snap-ring. Replace the snap-ring if bent, or distorted. Replace the thrust washers and retainer if worn, cracked or damaged in any way.

Examine the input gear carefully. Be sure the gear teeth and bearing surfaces are in good condition. Replace the gear if wear or damage is evident.

Check the input gear pilot bearing. Rotate the bearing and check for roughness or noise. Also check bearing position in the bore. The bearing should be recessed approximately 2.5 mm (0.100 in.) below the top edge of the bore. The bearing should not be seated at the bottom of the bore. Replace the bearing if worn, or roughness is evident. Replace both the gear and bearing if the bearing is a loose fit in the bore.

**GEAR CASE AND RETAINERS**

Examine both case halves and retainers carefully. Replace any retainer or case half if wear, cracks, or other damage is evident.

Check condition of the low range annulus gear and the shift rail bushing in the front case (Fig. 32). The low range annulus gear is not a serviceable part. Replace the gear and case as an assembly if the gear is loose, worn, or damaged. The shift rail bushing is a serviceable part and can be replaced if necessary.

**Fig. 32 Low Range Annulus Gear Location**

- 1 - LOW RANGE ANNULUS GEAR  
2 - SHIFT RAIL BUSHING

Check the bushing in the rear retainer. Replace the bushing if worn or scored.

Examine the sealing surfaces of both case halves and retainers. Small burrs, or scratches on these surfaces can be reduced with crocus cloth or a fine tooth file.

Examine condition of the shift rail bushing in the front case. If the bushing is worn or damaged, it can be removed with a blind hole type puller. A replacement bushing can be installed with a suitable size driver. Recess the bushing slightly below the edge of the bore but do not seat it all the into the case.

**GEARTRAIN**

Inspect the mainshaft splines, gear teeth and bearing surfaces carefully for evidence of wear, or damage. Replace the shaft if necessary. do not attempt to salvage it if damaged.

The shift rail and range fork are an assembly. Replace both parts if either is damaged. However, the nylon pads in the fork can be replaced if worn, or cracked.

Inspect the transfer case snap-rings closely. Do not attempt to salvage a distorted snap-ring by straightening or reshaping it. Replace any snap-ring that is distorted, or worn.

Inspect the low range gear, input gear and the gear thrust washers retainer, and snap-ring. The low range gear is serviced as an assembly only. Replace the gear if the case or pinions are damaged.

During inspection, also make sure the seal surface of the input gear is in good condition. Minor nicks on this surface can be reduced with crocus cloth. However, replace the gear if the seal surface is severely scored or worn.

**OIL PUMP AND PROGRESSIVE COUPLING**

The oil pump and progressive coupling are not serviceable components. Replace the coupling as an assembly if it is damaged. Replace the oil pump as an assembly if the gear teeth are worn, or if the pump has become damaged.

**BEARINGS AND SEALS**

The transfer case seals should be replaced during overhaul. Use new seals in the input gear bearing retainer, front case and rear retainer. Also replace the yoke seal washer and the detent plug O-ring.

Check condition of each transfer case bearing. Replace any bearing exhibiting signs of roughness, wear, or damage.

**ASSEMBLY**

Lubricate transfer case components with Mopar® Transfer Case Lubricant or petroleum jelly (where indicated) during assembly.

## TRANSFER CASE - NV247 (Continued)

**CAUTION:** The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

**BEARINGS AND SEALS**

(1) Remove front output shaft seal from front case with pry tool (Fig. 33).

**Fig. 33 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL  
2 - PRYBAR

(2) Remove snap-ring that retains front output shaft bearing in front case (Fig. 34).

**Fig. 34 Output Shaft Front Bearing Snap-Ring Removal**

- 1 - FRONT CASE  
2 - OUTPUT SHAFT FRONT BEARING  
3 - BEARING SNAP-RING

(3) Using tool 6953, remove bearing from front case (Fig. 35).

(4) Using tool 6953, install new bearing.

(5) Install snap-ring to hold bearing into case.

**Fig. 35 Remove Output Shaft Front Bearing**

- 1 - HANDLE C-4171  
2 - REMOVER/INSTALLER 6953

(6) Install new front output seal in front case with Installer Tool 6952-A as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 36). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

**Fig. 36 Front Output Seal Installation**

- 1 - INSTALLER 6952-A  
2 - TRANSFER CASE

## TRANSFER CASE - NV247 (Continued)

(7) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 37).

(8) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 38). **The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 39).**

80a98366

**Fig. 37 Output Shaft Rear Bearing Removal**

## TRANSFER CASE - NV247 (Continued)

(9) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from inside the annulus gear opening in the case. (Fig. 40).

J9521-43

**Fig. 40 Input Shaft Bearing Removal**

- 1 - SPECIAL TOOL C-4171  
2 - SPECIAL TOOL C-4210

(10) Install locating ring on new bearing.  
(11) Position case so forward end is facing upward.  
(12) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface (Fig. 41).

J8921-219

**Fig. 41 Seating Input Shaft Bearing**

- 1 - SNAP-RING  
2 - INPUT SHAFT BEARING

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input

gear and driving the bearing out with the drift and a hammer (Fig. 42).

(14) Install new pilot bearing with Installer 8128 and Handle C-4171 (Fig. 43).

80a11090

**Fig. 42 Remove Input Gear Pilot Bearing**

- 1 - DRIFT  
2 - INPUT GEAR

2 - INSTALLER 8128  
3 - INPUT GEAR

## TRANSFER CASE - NV247 (Continued)

(15) Remove front bearing retainer seal with suitable pry tool.

(16) Install new front bearing retainer with Installer 7884 (Fig. 44).

J9521-41

**Fig. 44 Install Front Bearing Retainer Seal**

- 1 - FRONT BEARING RETAINER
- 2 - SPECIAL TOOL 7884

## INPUT AND LOW RANGE GEAR

(1) Lubricate gears and thrust washers (Fig. 45) with transfer case lubricant.

(2) Install first thrust washer in low range gear (Fig. 45). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

(6) Align and install low range/input gear assembly in front case (Fig. 46). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

J9321-60

**Fig. 45 Input/Low Range Gear Components**

- 2 - RETAINER PLATE
- 3 - INPUT GEAR
- 4 - LOW RANGE GEAR
- 5 - THRUST WASHERS

J9321-61

**Fig. 46 Input/Low Range Gear Installation**

- 1 - ANNULUS GEAR
- 2 - INPUT/LOW RANGE GEAR

## TRANSFER CASE - NV247 (Continued)

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 47).

**Fig. 47 Install Input Gear Snap-Ring**

- 1 - INPUT GEAR  
2 - SNAP-RING

(8) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(9) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(10) Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION:** Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(11) Install bolts to hold retainer to transfer case (Fig. 48). Tighten to 21 N·m (16 ft. lbs.) of torque.

**Fig. 48 Install Front Bearing Retainer**

- 1 - FRONT BEARING RETAINER

## SHIFT FORKS AND MAINSHAFT

(1) Install new sector shaft O-ring and bushing (Fig. 49).

(2) Install shift sector (Fig. 50).

**Fig. 49 Sector O-Ring And Bushing Installation**

- 1 - SECTOR BUSHING  
2 - O-RING

**Fig. 50 Shift Sector Installation**

- 1 - SHIFT SECTOR

## TRANSFER CASE - NV247 (Continued)

(3) Install locking clutch spring, locking clutch, blockout spring, and range clutch sleeve, to mainshaft as shown in (Fig. 51). Install snap ring.

80ba7a52

**Fig. 51 Range Clutch Sleeve, Blockout Spring, Locking Clutch and Spring**

- 1 - LOCKING CLUTCH SPRING
- 2 - BLOCKOUT SPRING
- 3 - SNAP-RING
- 4 - RANGE CLUTCH SLEEVE
- 5 - LOCKING CLUTCH
- 6 - DRIVE SPROCKET HUB

(4) Install drive sprocket hub to mainshaft and manually load the needle bearings.

(5) Install new pads on range fork, if necessary.

(6) Install range shift fork to range clutch sleeve. Install mainshaft/range shift fork assembly into transfer case and input planetary assembly. Rotate fork until it engages with slot in shift sector.

(7) Install shift rail to shift range fork and transfer case housing.

(8) Rotate shift sector to NEUTRAL position.

(9) Install new O-ring on detent plug (Fig. 52).

(10) Lubricate detent plunger with transfer case lubricant or light coat of petroleum jelly.

(11) Install detent plunger, spring and plug (Fig. 52).

(12) Verify that plunger is properly engaged in sector.

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Lubricate front output shaft-sprocket assembly, drive chain and drive sprocket with transfer case lubricant.

(2) Assemble drive chain, drive sprocket and front output shaft (Fig. 53).

(3) Start drive sprocket on mainshaft.

(4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 53).

J9321-22

**Fig. 52 Shift Detent Components**

- 1 - DETENT PLUG
- 2 - DETENT SPRING
- 3 - DETENT PLUNGER
- 4 - PLUG O-RING

J9321-72

**Fig. 53 Installing Drive Chain, Front Output Shaft And Drive Sprocket**

- 1 - FRONT OUTPUT SHAFT
- 2 - DRIVE CHAIN
- 3 - MAINSHAFT
- 4 - DRIVE GEAR

## TRANSFER CASE - NV247 (Continued)

(5) Install drive sprocket snap-ring (Fig. 54).

80ba7a53

**Fig. 54 Installing Drive Sprocket Snap-Ring**

- 1 - MAINSHAFT DRIVE SPROCKET
- 2 - DRIVE SPROCKET SNAP-RING
- 3 - SNAP-RING PLIERS

- (6) Install roller bearings if removed.
- (7) Install progressive coupling (Fig. 55).
- (8) Install the progressive coupling thrust washer over the output shaft and against the coupling.
- (9) Install the oil pump locating snap-ring onto the output shaft.

J9321-17

**Fig. 55 Progressive Coupling Installation**

- 1 - SNAP-RING
- 2 - PROGRESSIVE COUPLING

(10) Install oil pickup tube in rear case. Be sure tube is seated in case notch as shown (Fig. 56).

J9321-73

**Fig. 56 Oil Pickup Tube Installation**

- 1 - CASE NOTCH
- 2 - OIL PICKUP TUBE ASSEMBLY
- 3 - CASE SLOT

(11) Install magnet in front case pocket (Fig. 57).

J8921-288

**Fig. 57 Installing Case Magnet**

- 1 - MAGNET

## TRANSFER CASE - NV247 (Continued)

(12) Clean sealing flanges of front case and rear case with a wax and grease remover.

(13) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes as shown (Fig. 58).

**Fig. 58 Applying Sealer To Front Case Flange**

- 1 - FRONT CASE FLANGE  
2 - SEALER BEAD

(14) Align and install rear case on front case (Fig. 59).

**Fig. 59 Rear Case Installation**

- 1 - REAR CASE  
2 - FRONT CASE

(15) Verify that oil pickup tube is still seated in case notch and tube end is pointed toward mainshaft (Fig. 60).

(16) Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (Fig. 61).

(17) Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

**Fig. 60 Checking Position Of Oil Pickup Tube**

- 1 - TUBE O-RING  
2 - CORRECT PICKUP TUBE POSITION

**Fig. 61 Alignment Bolt**

- 1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

## COMPANION FLANGE AND RANGE LEVER

(1) Install range lever, washer and locknut on sector shaft (Fig. 62). Tighten locknut to 27-34 N·m (20-25 ft. lbs.) torque.

**Fig. 62 Range Lever Installation - Typical**

- 1 - RANGE LEVER  
2 - WASHER  
3 - LOCKNUT

## TRANSFER CASE - NV247 (Continued)

(2) Install new seal washer on front output shaft (Fig. 63).

(3) Lubricate flange hub with transfer case lubricant and install flange on front shaft.

(4) Install new seal washer on front shaft.

(5) Install companion flange and new nut on front output shaft.

(6) Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold flange while tightening yoke nut.

**Fig. 63 Flange Seal Washer Installation**

1 - YOKE SEAL WASHER

### REAR RETAINER AND OIL PUMP

(1) Install new O-ring on flanged end of oil pickup tube.

(2) Install oil pump (Fig. 64).

(3) Insert oil pickup tube in pump (Fig. 65).

(4) Install rear bearing on mainshaft (Fig. 65). Locating ring groove in bearing goes toward end of mainshaft.

(5) Install rear bearing retaining snap-ring (Fig. 66).

**Fig. 64 Installing Oil Pump**

1 - OIL PUMP  
2 - TUBE O-RING  
3 - OIL PICKUP TUBE

(6) Install rear bearing locating ring in rear retainer, if ring was removed during overhaul.

**Fig. 65 Rear Bearing Installation**

1 - REAR BEARING

**Fig. 66 Rear Bearing Snap-Ring Installation**

1 - REAR BEARING  
2 - SNAP-RING PLIERS  
3 - SNAP-RING

(7) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting surface of rear retainer. Allow sealer to set-up slightly before proceeding.

(8) Slide rear retainer onto mainshaft (Fig. 67).

(9) Spread rear bearing locating ring and slide rear retainer into place on rear case (Fig. 68).

(10) Install and tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.).

**Fig. 67 Rear Retainer Installation**

1 - REAR CASE  
2 - REAR RETAINER

## TRANSFER CASE - NV247 (Continued)

(11) Install rubber access plug (Fig. 69).

**Fig. 68 Engaging Rear Bearing Locating Ring**

- 1 - REAR RETAINER  
2 - PARALLEL JAW SNAP-RING PLIERS

**Fig. 69 Installing Rubber Access Plug**

- 1 - PLUG

## FINAL ASSEMBLY

- (1) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.) torque.
- (2) Level transfer case and fill it with Mopar® Transfer Case Lubricant. Correct fill level is to bottom edge of fill plug hole.
- (3) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.) torque.

## INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case on transmission.
- (5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 70).

**Fig. 70 Install Transfer Case**

- 1 - NV247 TRANSFER CASE

(6) Connect front propeller shaft and install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(7) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

(8) Install rear crossmember (Fig. 71) and skid plate, if equipped. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

**Fig. 71 Crossmember Installation**

- 1 - CROSSMEMBER  
2 - REAR TRANSMISSION MOUNT

- (9) Remove transmission jack and support stand.
- (10) Verify transfer case is in NEUTRAL. Connect shift cable to transfer case range lever.
- (11) Lower vehicle and verify transfer case shift operation.
- (12) Adjust the transfer case shift cable, if necessary.

## TRANSFER CASE - NV247 (Continued)

## SPECIFICATIONS

## TRANSFER CASE - NV247

## TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Bolt, crossmember	41-47	30.2-34.7	-

## FLUID

STANDARD PROCEDURE - FLUID DRAIN/  
REFILL

The fill and drain plugs are both in the rear case (Fig. 72).

80b09a60

**Fig. 72 Fill/Drain Plug and I.D. Tag Location - Typical**

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® Transfer Case Lubricant.
- (7) Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
- (8) Lower vehicle.

## FRONT OUTPUT SHAFT SEAL

### REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Remove front output shaft companion flange.
- (4) Remove seal from front case with pry tool (Fig. 73).

**Fig. 73 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL  
2 - PRYBAR

### INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 6952-A as follows:
  - (a) Place new seal on tool. Garter spring on seal goes toward interior of case.
  - (b) Start seal in bore with light taps from hammer (Fig. 74). Once seal is started, continue tapping seal into bore until installer tool seats against case.
- (2) Install companion flange and torque nut to 122-176 N·m (90-130 ft. lbs.).
- (3) Install front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

**Fig. 74 Front Output Seal Installation**

- 1 - INSTALLER 6952-A  
2 - TRANSFER CASE

## REAR RETAINER BUSHING AND SEAL

### REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.
- (4) Using Remover 6957, remove bushing from rear retainer (Fig. 75).

**Fig. 75 Rear Retainer Bushing Removal**

- 1 - REMOVER 6957  
2 - REAR RETAINER BUSHING

## REAR RETAINER BUSHING AND SEAL (Continued)

**INSTALLATION**

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in retainer.
- (3) Using Installer 8145, drive bushing into retainer until installer seats against case (Fig. 76).
- (4) Using Installer C-3995-A, install seal in rear retainer (Fig. 77).

80a9836c

**Fig. 76 Rear Retainer Bushing Installation**

- 1 - REAR RETAINER BUSHING
- 2 - INSTALLER 8145

80a983a7

**Fig. 77 Install Rear Retainer Seal**

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL C-3995-A

- (5) Install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (6) Verify proper fluid level.
- (7) Lower vehicle.

**SHIFT CABLE****REMOVAL**

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Disconnect the shift cable eyelet from the transfer case shift lever (Fig. 78).
- (4) Remove shift cable from the cable support bracket.

**Fig. 78 Transfer Case Shift Cable at Transfer Case**

- 1 - TRANSFER CASE SHIFT LEVER
- 2 - TRANSFER CASE SHIFT CABLE

- (5) Lower vehicle.
- (6) Remove any necessary console parts for access to shift lever assembly and shift cable.
- (7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 79).
- (8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 80).
- (9) Pull cable through floor panel opening.
- (10) Remove transfer case shift cable from vehicle.

## SHIFT CABLE (Continued)

**Fig. 79 Transfer Case Shift Cable at Shifter**

- 1 - CLIP
- 2 - SHIFTER
- 3 - TRANSFER CASE SHIFT LEVER PIN
- 4 - TRANSFER CASE SHIFT CABLE

**INSTALLATION**

- (1) Route cable through hole in floor pan.
- (2) Install seal plate to studs in floor pan.
- (3) Install nuts to hold seal plate to floor pan (Fig. 80). Tighten nuts to 7 N·m (65 in.lbs.).
- (4) Install the transfer case shift cable to the shifter assembly bracket. Seat cable in bracket and install clip (Fig. 79).
- (5) Verify the transfer case shift lever (at console) is in the NEUTRAL position.
- (6) Snap the cable onto the shift lever pin (Fig. 79).

**Fig. 80 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
- 2 - TRANSMISSION SHIFT CABLE
- 3 - TRANSFER CASE SHIFT CABLE

- (7) Raise the vehicle.
- (8) Install the shift cable to the shift cable support bracket and install clip (Fig. 78).
- (9) Verify that the transfer case is still in the NEUTRAL position.
- (10) Snap the shift cable onto the transfer case shift lever (Fig. 78).
- (11) Lower vehicle.
- (12) Verify correct transfer case operation in all ranges.
- (13) Install any console parts removed for access to transfer case shift cable.

## TIRES/WHEELS

### DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 1).

Lateral runout is the **wobble** of the tire or wheel.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

### METHOD 1 (RELOCATE WHEEL ON HUB)

(1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

(2) Check wheel bearings and adjust if adjustable or replace if necessary.

(3) Check the wheel mounting surface.

(4) Relocate wheel on the mounting, two studs over from the original position.

## TIRES/WHEELS (Continued)

J9022-4

**Fig. 1 Checking Tire/Wheel/Hub Runout**

- 1 - RADIAL RUNOUT  
2 - LATERAL RUNOUT

(5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.

(6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

**METHOD 2 (RELOCATE TIRE ON WHEEL)**

**NOTE:** Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

(1) Remove tire from wheel and mount wheel on service dynamic balance machine.

(2) Check wheel radial runout (Fig. 2) and lateral runout (Fig. 3).

- **STEEL WHEELS:** Radial runout 0.040 in., Lateral runout 0.045 in. (average-maximum)

- **ALUMINUM WHEELS:** Radial runout 0.030 in., Lateral runout 0.035 in. (average-maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout or match mount, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).

**STANDARD PROCEDURE****STANDARD PROCEDURE - TIRE AND WHEEL BALANCE**

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for

80f2f241

**Fig. 2 RADIAL RUNOUT**

4 - WING NUT  
5 - PLASTIC CUP  
6 - WHEEL

steel wheels. For aluminum wheel use back cone mounting method without cone spring.

**NOTE:** Static should be used only when a two plane balancer is not available.

**NOTE:** Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

## TIRES/WHEELS (Continued)

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight

required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 4).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 5).

## TIRES/WHEELS (Continued)

**STANDARD PROCEDURE - MATCH MOUNTING**

Tires and wheels are currently not match mounted at the factory. Match mounting is a technique used to reduce runout in the wheel/tire assembly. This means that the high spot of the tire is aligned with the low spot on the wheel rim. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the rim is identified with a label on the outside of the rim and a dot on the inside of the rim. If the outside label has been removed the tire will have to be removed to locate the dot on the inside of the rim.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Use a dial indicator to locate the high spot of the tire on the center tread rib (Fig. 6). Record the indicator reading and mark the high spot on the tire. Place a mark on the tire at the valve stem location (Fig. 7).

PRI951A

**Fig. 6 Dial Indicator**

(2) Break down the tire and remount it 180 degrees on the rim (Fig. 8).

(3) Measure the total runout again and mark the tire to indicate the high spot.

(4) If runout is still excessive use the following procedures.

(a) If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.

(b) If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).

(c) If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 9). This procedure will normally reduce the runout to an acceptable amount.

1 - 2ND HIGH SPOT ON TIRE  
2 - 1ST HIGH SPOT ON TIRE

## STANDARD PROCEDURE - TIRE ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is (Fig. 10). Other rotation methods can be used, but they will not provide all the tire longevity benefits.

8031e864

**Fig. 10 Tire Rotation Pattern**

## STANDARD PROCEDURE - WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

**NOTE: Do not use chrome plated lug nuts with chrome plated wheels.**

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification (Fig. 11). **Never use oil or grease on studs or nuts.**

80fa8998

**Fig. 11 LUG NUT TIGHTENING PATTERN**

## TIRES

### DESCRIPTION

### DESCRIPTION - TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most

## TIRES (Continued)

cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE), This will help to achieve a greater tread life.

## TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 12).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

## TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

## DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

**Fig. 12 Tire Identification**

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

## DESCRIPTION - TIRE INFLATION PRESSURES

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 13).

**Fig. 13 Under Inflation Wear**

1 - THIN TIRE THREAD AREAS

## TIRES (Continued)

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 14).

J9222-2

**Fig. 14 Over Inflation Wear**

1 - THIN TIRE THREAD AREA

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicle's Owners Manual. A Certification Label on the driver's side door pillar provides the minimum tire and rim size for the vehicle. The label also lists the cold inflation pressure for these tires at full load operation.

Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Tire inflation pressures are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or be driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure build-up.

**WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.**

#### DESCRIPTION - TIRE PRESSURE FOR HIGH SPEED

Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very

important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire sidewall.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

#### DESCRIPTION - REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

**WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.**

#### DIAGNOSIS AND TESTING

##### DIAGNOSIS AND TESTING - PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

##### DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 15).

## TIRES (Continued)

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

J8922-5

**Fig. 15 Tread Wear Indicators**

- 1 - TREAD ACCEPTABLE  
2 - TREAD UNACCEPTABLE  
3 - WEAR INDICATOR

## DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 16).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 16).

## DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

## DIAGNOSIS AND TESTING - TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem (Fig. 17).

## STANDARD PROCEDURE - REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 18). The tire should be replaced if the puncture is located in the sidewall.

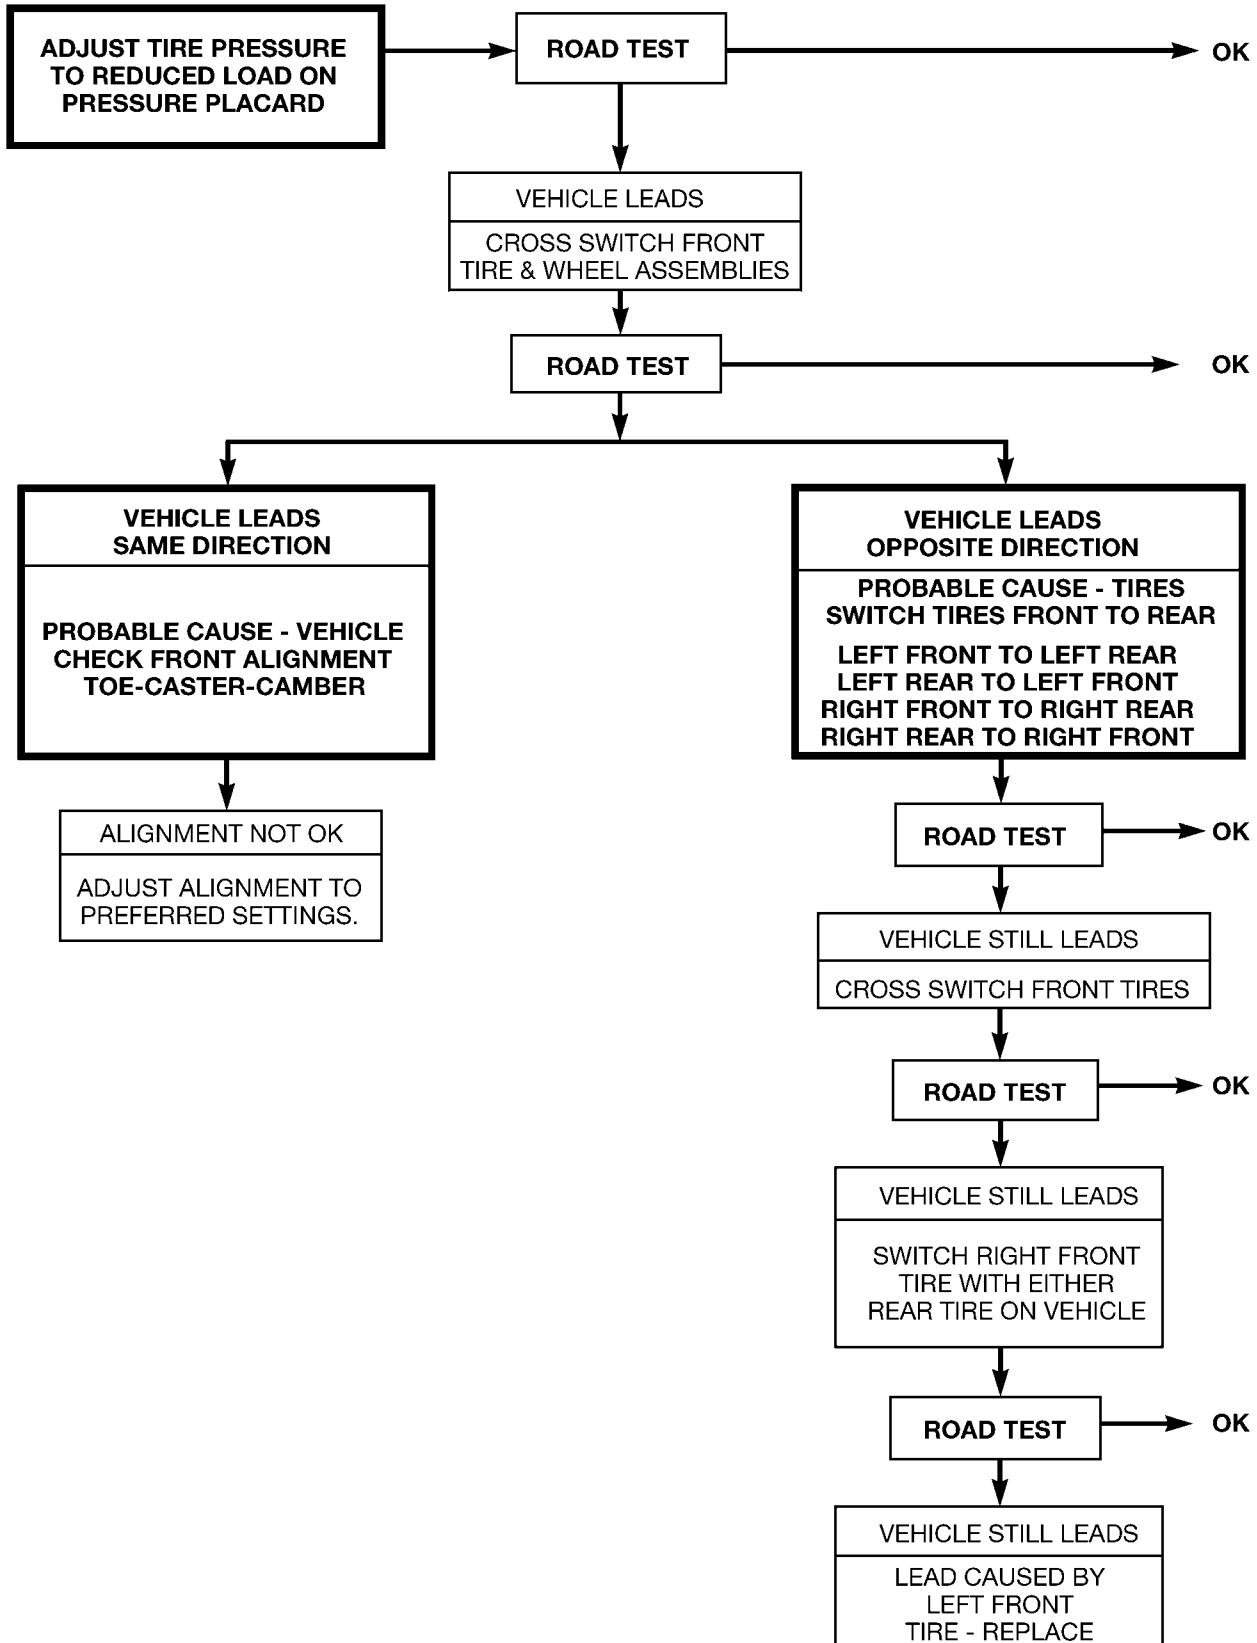

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT							
CAUSE	UNDER-INFLATION OR LACK OF ROTATION	OVER-INFLATION OR LACK OF ROTATION	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER	INCORRECT TOE	UNBALANCED WHEEL OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	ROTATE TIRES AND INSPECT SUSPENSION SEE GROUP 2

\*HAVE TIRE INSPECTED FOR FURTHER USE.

RN797

**Fig. 16 Tire Wear Patterns**

## TIRES (Continued)

80a53b5b

Fig. 17 VEHICLE LEAD DIAGNOSIS AND CORRECTION CHART

## TIRES (Continued)

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

**Fig. 18 Tire Repair Area**

1 - REPAIRABLE AREA

## CLEANING

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

**NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.**

## SPARE TIRE

### DESCRIPTION

#### DESCRIPTION - SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

#### DESCRIPTION - FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire. It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

**Fig. 19 Safety Rim**

- 1 - FLANGE
- 2 - RIDGE
- 3 - WELL

## WHEELS

### DESCRIPTION

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rim are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 19).

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

### DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

**NOTE:** Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

**WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.**

### STANDARD PROCEDURE - WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

**NOTE:** Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening

## WHEELS (Continued)

of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

## TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Lug Nut 1/2 X 20 with 60° Cone	115-150	85-115	—

## STUDS

## REMOVAL

**CAUTION:** Do not use a hammer to remove wheel studs.

- (1) Raise and support vehicle.
- (2) Remove wheel and tire assembly.
- (3) Remove brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Remove stud from hub with Remover C-4150A (Fig. 20).

## INSTALLATION

**CAUTION:** Do not use a hammer to remove wheel studs.

- (1) Install the new stud into the hub flange.
- (2) Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
- (3) Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
- (4) Remove the lug nut and washers.

**Fig. 20 Wheel Stud Removal**

- 1 - REMOVER  
2 - WHEEL STUD

(5) Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

- (6) Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
- (7) Remove the support and lower vehicle.

## TIRE PRESSURE MONITORING SYSTEM

### DESCRIPTION

The EVIC will monitor the tire pressure signals from the four tire sensors (five sensors in the case of vehicles with the chrome wheel option) and determine if any tire has gone below the low pressure threshold or raised above the high pressure threshold. Refer to the table below.

LOW TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
ON	172 kPa (25 PSI)
OFF	193 kPa (28 PSI)

HIGH TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
ON	310 kPa (45 PSI)
OFF	276 kPa (40 PSI)

The Remote Tire Pressure Monitors (RTPM) are not internally serviceable. For a Sensor Failure or Low Battery fault, the RTPM must be replaced.

### SPECIFICATIONS

#### TORQUE CHART

##### TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Tire Pressure Sensor/ Transmitter Mounting Nut	7	—	64

### OPERATION

If equipped with the Tire Pressure Monitoring System, each of the vehicle's four (or five for chrome wheel option) wheels will have a valve stem with a pressure sensor and radio transmitter built in. Signals from the tire pressure sensors are received and interpreted by the Electronic Vehicle Information Center (EVIC). A sensor in a mounted wheel will broadcast its detected pressure once per minute when the vehicle is moving faster than 40 km/h (25 mph). The spare tire sensor will broadcast once every hour. Each sensor's broadcast is uniquely coded so that the EVIC can determine location. The individual tire pressures can be displayed graphically on the EVIC

### DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING SYSTEM

All Tire Pressure Monitoring System Faults are specific to one location. If a "BATTERY LOW" or "SENSOR FAILURE" fault is detected, the location will be displayed. The appropriate sensor/transmitter can then be replaced. If a single sensor/transmitter cannot be detected by the EVIC, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the EVIC section. For additional system description and diagnosis, refer to Tire Pressure Monitoring in the Body Diagnostic manual.

## SENSOR

### STANDARD PROCEDURE - TIRE PRESSURE SENSOR RETRAIN

**WARNING:** DEATH OR SERIOUS INJURY CAN OCCUR IF MAGNETICALLY SENSITIVE DEVICES ARE EXPOSED TO THE RELEARN MAGNET. MAGNETS CAN AFFECT PACEMAKERS.

**CAUTION:** Never attempt to train more than one vehicle at a time. System is capable of reading tire pressure sensor transmissions from other nearby vehicles while in train mode.

Each time a wheel rotation or tire pressure sensor replacement occurs the tire pressure sensors must be retrained. This is necessary to inform the Electronic Vehicle Information Center (EVIC) that a sensor change was made and the new locations of the sensors. Retraining is accomplished through the EVIC used in conjunction with a Re-learn Magnet, Special Tool 8821.

**NOTE:** Use the following procedure to retrain all tire pressure sensors (four or five sensor systems). No attempt should be made to retrain individual sensors.

- (1) Retrieve Re-learn Magnet, Special Tool 8821.
- (2) Press MENU Button on EVIC until "RETRAIN TIRE SENSORS - NO" is displayed.
- (3) Press STEP button to select "YES".

**NOTE:** There is a 60 second timer for training the first sensor and a 30 second timer between training the remaining sensors. If either of these timers expire, the EVIC will abort the training procedure.

**NOTE:** If at any time the EVIC display reads "TRAINING ABORTED", move the vehicle ahead at least one foot and repeat the entire retraining procedure.

- (4) Press MENU button to start retraining. Display will read "TRAIN LEFT FRONT TIRE"

**NOTE:** The order for retraining all five sensors is:

- Left Front
- Right Front
- Right Rear
- Left Rear
- Spare (if so equipped)

- (5) Starting at left front tire, place Re-learn Magnet over valve stem (Fig. 21). Within approximately 5 seconds, vehicle horn will chirp indicating training complete for that particular sensor. Remove the magnet.

80ce7745

**Fig. 21 Magnet Placement Over Valve Stem**

- 1 - RE-LEARN MAGNET
- 2 - VALVE STEM

- (6) Repeat step (6) on remaining sensors as indicated by EVIC until all TPM sensors positions are trained.

- (7) Once EVIC displays "TRAINING COMPLETE", pressing either STEP, C/T, RESET or MENU button will exit training routine.

### REMOVAL - TIRE PRESSURE SENSOR/TRANSMITTER

- (1) Remove the tire/wheel from the vehicle.

**CAUTION:** When removing the stick on balancing weights from the wheel, do not use an abrasive cleaner or a cleaner which will damage the protective finish on the wheel.

- (2) Remove the balancing weights from the wheel.

**NOTE:** The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for re-use. Do not substitute a regular valve stem cap in its place.

- (3) Remove the cap from the valve stem.

**NOTE:** The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted for a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

- (4) Using the appropriate tool, remove the core from the valve stem (Fig. 22).
- (5) Let the tire fully deflate.

## SENSOR (Continued)

80ab3710

**Fig. 22 REMOVING VALVE STEM CORE - TYPICAL**

- 1 - WHEEL
- 2 - VALVE STEM
- 3 - TIRE
- 4 - VALVE STEM CORE TOOL

**CAUTION:** The pressure transmitter must be removed from the wheel and dropped into the tire prior to breaking the bead and dismounting the tire. Failure to do this will greatly increase the risk of damaging the pressure transducer when servicing the tire.

(6) Remove nut mounting valve stem of pressure sensor/transmitter to the wheel (Fig. 23). Drop sensor/transmitter into tire.

80add3eb

**Fig. 23 VALVE STEM/PRESSURE TRANSMITTER - TYPICAL**

- 1 - NUT
- 2 - WHEEL
- 3 - TIRE
- 4 - VALVE STEM

**CAUTION:** When breaking the top and bottom bead of the tire off the wheel, care must be used so the bead breaking mechanism on the tire changer does not damage the wheel. This includes the surface of the wheel flange on the inside of the wheel.

(7) Using the tire changer manufacturers procedure, first break down the upper bead of the tire. Then break down the bottom bead of the tire.

**CAUTION:** When dismounting the upper tire bead from the wheel, the proper procedure must be used. Not using the proper procedure will result in damage to the wheel and tire.

(8) Dismount the upper bead of the tire from the wheel. **The upper bead must be fully dismounted from the wheel to remove the tire pressure transmitter from the inside of the tire. The bottom bead of the tire does not need to be removed from the wheel.**

(9) Pull upward on the tire (Fig. 24). Reach into the tire and remove the pressure sensor/transmitter from inside the tire.

80ab3711

**Fig. 24 PRESSURE TRANSMITTER REMOVAL - TYPICAL**

- 1 - TIRE
- 2 - WHEEL
- 3 - PRESSURE TRANSMITTER

**INSTALLATION - TIRE PRESSURE SENSOR/TRANSMITTER**

**NOTE:** When installing the tire pressure sensor/transmitter, inspect the sealing O-ring at the bottom of the valve stem for any sign of damage or deterioration. Replace O-ring if necessary, before installing the pressure transmitter on the wheel. Also, be sure the surface of the wheel that the O-ring seals against is clean and not damaged.

## SENSOR (Continued)

(1) Install the tire pressure sensor/transmitter on the wheel (Fig. 25).

80ab3713

**Fig. 25 TIRE PRESSURE SENSOR/TRANSMITTER - TYPICAL**

- 1 - WHEEL  
2 - TIRE PRESSURE TRANSMITTER

(2) Tighten the tire pressure sensor/transmitter mounting nut to a torque of 7 N·m (64 in. lbs.) (Fig. 26). When tightening the sensor/transmitter nut, hold the transmitter so it does not rotate. If the sensor/transmitter rotates so the top edge is not level with the wheel (Fig. 27), damage to the transmitter will occur when mounting the tire. If the top edge of the transmitter is not level with the wheel, it can be rotated into position by lightly tapping it with your hand.

**CAUTION:** When mounting the upper bead of the extended mobility tire, the proper procedure must be used. Not using the proper procedure will result in damage to the wheel and tire.

- (3) Mount the upper bead of the tire on the wheel.  
(4) Install the original or an OEM replacement valve stem cap on the valve stem.  
(5) Using a soap solution, check that no air leak is present where the valve stem mounts to the wheel.  
(6) Balance the tire/wheel assembly using the correct procedure for using wheel flange mount and stick-on wheel weights. For balancing information and wheel weight positioning, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).  
(7) Install the tire/wheel on the vehicle (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).  
(8) Program the identification code for the new tire pressure sensor/transmitter into the TPM module.

80ab3714

**Fig. 26 TIGHTENING SENSOR/TRANSDUCER - TYPICAL**

- 1 - TORQUE WRENCH  
2 - WHEN TORQUING TRANSMITTER MOUNTING NUT DO NOT LET THIS END OF TRANSMITTER ROTATE AWAY FROM THE WHEEL  
3 - WHEEL

**Fig. 27 CORRECTLY POSITIONED SENSOR/TRAN - TYPICAL**

- 1 - THE TOP EDGES OF THE TIRE PRESSURE SENSOR/TRANSMITTER MUST BE FLUSH WITH THE WHEEL HERE  
2 - WHEEL  
3 - TIRE PRESSURE SENSOR/TRANSMITTER

(9) Verify that the TPM module has been programmed with the identification code from the new tire pressure sensor/transmitter. Refer to the appropriate electrical section. If the identification code and tire pressure thresholds from the new tire pressure transmitter are present in the receiver's memory, the new tire pressure transmitter has been correctly programmed to the receiver.

### WARNING

#### SAFETY PRECAUTIONS AND WARNINGS

**WARNING: USE AN OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**

- **AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**

- **DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

**CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.**

- **Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**

- **Always have a fire extinguisher ready for use when welding.**

- **Disconnect the negative (-) cable clamp from the battery when servicing electrical components**

that are live when the ignition is OFF. Damage to electrical system can result.

- **Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**

- **Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**

- **Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

### DIAGNOSIS AND TESTING

#### DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and

## BODY (Continued)

excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

**VISUAL INSPECTION BEFORE WATER LEAK TESTS**

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

**WATER LEAK TESTS**

**WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

**WATER LEAK DETECTION**

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity,

often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

**MIRROR INSPECTION METHOD**

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

**BRIGHT LIGHT LEAK TEST METHOD**

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

**PRESSURIZED LEAK TEST METHOD**

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

**DIAGNOSIS AND TESTING - WIND NOISE**

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

## BODY (Continued)

**VISUAL INSPECTION BEFORE TESTS**

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

**ROAD TESTING WIND NOISE**

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

**POSSIBLE CAUSE OF WIND NOISE**

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

**STANDARD PROCEDURE****STANDARD PROCEDURE - BODY LUBRICATION**

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

(1) When necessary, lubricate the operating mechanisms with the specified lubricants.

(2) Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.

(3) Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.

(4) The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.

(5) The door lock cylinders should be lubricated twice each year (preferably autumn and spring).

(a) Spray a small amount of lock cylinder lubricant directly into the lock cylinder.

(b) Apply a small amount to the key and insert it into the lock cylinder.

(c) Rotate it to the locked position and then back to the unlocked position several times.

(d) Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

**STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR**

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

**Rigid Plastics:**

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

**Semi-Rigid Plastics:**

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

**Flexible Plastics:**

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

**Repair Procedure:**

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

**Adhesion Promoter/Surface Modifier:**

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

## BODY (Continued)

## SAFETY PRECAUTION AND WARNINGS

## WARNING:

- EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.
- USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
- AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.

- DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

## NOTE:

- When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.
- Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

## RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION

**PANEL SECTIONING**

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

80b6fedc

**Fig. 1 PANEL SECTIONING**

- 1 - EXISTING PANEL
- 2 - NEW PANEL
- 3 - PANEL ADHESIVE
- 4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of

water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

**PANEL REINFORCEMENT**

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement (Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

80b6fedf

**Fig. 2 SOFTENED EDGES**

- 1 - SOFTENED EDGES
- 2 - PANEL ADHESIVE
- 3 - BONDING STRIP

## BODY (Continued)

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

80b6fee0

**Fig. 3 PANEL REINFORCEMENT**

- 1 - PANEL ADHESIVE  
2 - REINFORCEMENT

80b6fee1

**Fig. 4 BEVELING ANGLE - 20 DEGREE**

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).

- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.

- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

## VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected

80b6fee2

**Fig. 5 FIBERGLASS TAPE**

carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

80b6fee3

**Fig. 6 DAMAGE COMPONENT**

- 1 - PUNCTURE

## PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

## BODY (Continued)

## PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

**Fig. 7 DAMAGED PANEL CUTOUT AND PATCH**

- 1 - CUTOUT
- 2 - DAMAGED BODY PANEL
- 3 - 4 MM (0.160 IN.) HOLES
- 4 - PATCH CUT TO SIZE

## PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

**Fig. 8 FABRICATED PANEL**

- 1 - STRUCTURAL ADHESIVE
- 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
- 3 - WIDTH OF V-GROOVE
- 4 - WAXED PAPER

## PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

## BODY (Continued)

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

**Fig. 9 SECURE SUPPORT SQUARES TO BODY PANEL**

- 1 - SUPPORT SQUARES
- 2 - SCREWS
- 3 - DAMAGED BODY PANEL

(12) Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

**Fig. 10 POSITION PATCH IN CUTOUT AND ALIGN**

- 1 - CUTOUT
- 2 - SUPPORT SQUARES

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

**Fig. 11 APPLY ADHESIVE TO SUPPORT SQUARES**

- 1 - APPLICATOR
- 2 - SUPPORT SQUARES
- 3 - ADHESIVE

**Fig. 12 INSTALL SCREWS**

- 1 - PATCH
- 2 - GAP

## BODY (Continued)

(16) Allow adhesive to cure, and remove all screws.

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

(18) Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch (Fig. 14).

(19) Mix enough adhesive to cover the entire patch area.

(20) Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair (Fig. 15).

**Fig. 13 GRIND SURFACE**

- 2 - MESH
- 3 - PATCH
- 4 - SPREADER

### PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

### STANDARD PROCEDURE - BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the Buzz, Squeak & Rattle Kit table for material contents and usage.

## BODY (Continued)

*BUZZ, SQUEAK & RATTLE KIT*

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 225° Fahrenheit (-40° to 107° Celsius)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut busings, sway bars.	-40° to 390° Fahrenheit (-40° to 200° Celsius)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-30° to 400° Fahrenheit (-34° to 205° Celsius)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-30° to 400° Fahrenheit (-34° to 205° Celsius)

## LIFTGATE

### DIAGNOSIS AND TESTING - LIFTGATE

When the liftgate fails to open as designed, the possible causes may be one of more of the following:

POSSIBLE CAUSES	CORRECTION
The liftgate may be out of adjustment.	(Refer to 23 - BODY/LIFTGATE/LIFTGATE - ADJUSTMENTS)
The liftgate latch striker(s) may be worn or out of adjustment.	Replace the striker. (Refer to 23 - BODY/LIFTGATE/LATCH STRIKER - REMOVAL) Adjust the striker.
The liftgate guide plate(s) may be worn or out of adjustment.	Replace the guide plates. (Refer to 23 - BODY/LIFTGATE/ALIGNMENT GUIDE PLATE - REMOVAL) Adjust the guide plate.
One or both of the latches may be worn or do not operate smoothly.	Replace the latch. (Refer to 23 - BODY/LIFTGATE/LATCH - REMOVAL)
The liftgate latch actuator (power lock motor) is inoperative.	Replace the actuator. (Refer to 8 - ELECTRICAL/POWER LOCKS/LIFTGATE LOCK MOTOR)
The latch rod between the outside latch handle and the latch control assembly is loose or out of adjustment.	Replace the rod clips. (Refer to 23 - BODY/LIFTGATE/LATCH - CONTROL ASSEMBLY - REMOVAL) Adjust the latch control assembly rod. (Refer to 23 - BODY/LIFTGATE/LATCH - CONTROL ASSEMBLY - ADJUSTMENTS)
One or both latch cables is either loose, binding, stretched, or out of adjustment.	Replace the cable(s). (Refer to 23 - BODY/LIFTGATE/LATCH - CABLES - REMOVAL) Adjust the latch cables. (Refer to 23 - BODY/LIFTGATE/LATCH - CABLES - ADJUSTMENTS)

## EXTERIOR HANDLE

### REMOVAL

(1) Remove the insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - REMOVAL)

(2) Open the actuator rod clip and disconnect the actuator rod. (Fig. 1)

(3) Remove the nuts attaching the handle to the liftgate and remove the handle.

### INSTALLATION

(1) Position the exterior handle on the liftgate.

(2) Install the nuts attaching exterior handle to liftgate and tighten to 9 N·m (80 in. lbs.).

(3) Connect exterior handle link and adjust. (Refer to 23 - BODY/LIFTGATE/LATCH CONTROL ASSEMBLY - ADJUSTMENTS)

(4) Install the liftgate insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - INSTALLATION)

80ebce54

**Fig. 1 EXTERIOR HANDLE**

- 1 - NUTS (2)
- 2 - ACTUATOR ROD CLIP
- 3 - ACTUATOR ROD
- 4 - EXTERIOR HANDLE

## FLIP-UP GLASS

### REMOVAL

**CAUTION:** Do not disconnect the flip-up glass hinges with the liftgate flip up glass closed. The prop rod pistons are operated by high pressure gas. This pressure could cause damage and/or personal injury if they are removed while the pistons are compressed.

- (1) Using a trim stick C-4755 or equivalent, separate the glass hinge cover from the hinge on the liftgate (Fig. 2).
- (2) Open and support the liftgate glass.
- (3) Using a trim stick C-4755 or equivalent, gently pry open the locking caps on the end of the prop rods.

- (4) Remove prop rod cylinders from ball studs.
- (5) Lower the glass.
- (6) Remove the bolts that secure the glass hinges to the liftgate and remove the glass.

### INSTALLATION

- (1) Position the glass on liftgate.
- (2) Install hinge bolts and hand tighten.
- (3) With the glass panel in the fully open position, push the glass forward to completely seat the hinges and tighten the bolts to 7 N·m (60 in. lbs.).
- (4) Install prop rods on ball studs and compress locking caps to lock rods on ball studs.
- (5) Lower the glass and install the hinge covers.
- (6) Check the flip up glass for proper alignment and latching.

**Fig. 2 FLIP-UP GLASS**

- 1 - FLIP-UP GLASS
- 2 - HINGE COVER
- 3 - SUPPORT PROP

- 4 - BUMPER
- 5 - BUMPER

## FLIP-UP GLASS LATCH

### REMOVAL

- (1) Open liftgate glass.
- (2) Remove the trim panel (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL).
- (3) Remove the nuts and remove the latch. (Fig. 3)
- (4) Disconnect switch electrical connectors.
- (5) Remove latch from liftgate.

**Fig. 3 FLIP-UP GLASS LATCH**

1 - LATCH  
2 - LIFTGATE

### INSTALLATION

- (1) Position the latch on the liftgate (Fig. 3).
- (2) Connect switch electrical connectors.
- (3) Adjust latch to the proper position, and tighten the nuts to 12 N·m (9 ft. lbs.).
- (4) Close the glass and verify proper operation.
- (5) Install the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - INSTALLATION)

## FLIP-UP GLASS LATCH STRIKER

### REMOVAL

- (1) Raise the flip up glass.
- (2) Using a grease pencil or equivalent, mark the position of the handle/striker on the glass.
- (3) Remove the screws attaching the handle/striker to the glass.

### INSTALLATION

- (1) Position the handle/striker on the glass panel and align the reference marks.
- (2) Install the screws attaching the handle/striker to the glass panel and tighten to 7 N·m (60 in. lbs.).

## FLIP-UP GLASS SWITCH

### REMOVAL

- (1) Remove license plate lamp housing/trim panel from liftgate. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP UNIT - REMOVAL)
- (2) Squeeze the locking tabs inward to release the switch from the housing.
- (3) Disconnect the switch harness connector, remove the switch from the housing.

### INSTALLATION

- (1) Connect the switch harness electrical connector.
- (2) Position switch in housing, snap switch into place.
- (3) Install license plate lamp housing/trim panel onto liftgate. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP UNIT - INSTALLATION)

## HINGE

## REMOVAL

**NOTE:** It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

- (1) Open and support the liftgate.
- (2) Remove the upper liftgate opening trim panel. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL)
- (3) Using a grease pencil or equivalent, mark the hinge location.
- (4) Remove the hinge screws and remove the hinge. (Fig. 4) and (Fig. 5)

**Fig. 4 HINGE**

- 1 - LIFTGATE HINGE
- 2 - HINGE TO HEADER BOLTS (3 PER SIDE)
- 3 - LIFTGATE SUPPORT CYLINDER
- 4 - FLIP-UP GLASS SUPPORT CYLINDER LOCK CAP
- 5 - LIFTGATE
- 6 - FLIP-UP GLASS SUPPORT CYLINDER
- 7 - FLIP-UP GLASS

**Fig. 5 LIFTGATE HINGE**

- 1 - HINGE
- 2 - LIFTGATE
- 3 - SCREWS (2)

## INSTALLATION

**NOTE:** It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

**NOTE:** Use a suitable body sealer on the hinge to body mating surfaces prior to installation.

- (1) Position the hinge on the roof panel and on the liftgate.
- (2) Install and tighten hinge screws at roof panel to 28 N·m (21 ft. lbs.).
- (3) Install hinge screws at liftgate and tighten to 28 N·m (21 ft. lbs.).
- (4) Install the upper liftgate opening trim panel. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION)
- (5) Check the liftgate for proper alignment and operation. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (6) Check for water leaks at hinge to body screws.

## LATCH/GUIDE PLATE

### REMOVAL

- (1) Remove the liftgate insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - REMOVAL)
- (2) Remove the three bolts attaching the latch and guide plate to the liftgate. (Fig. 6)
- (3) Remove the latch.
- (4) Squeeze the cable retainer clips and remove the cable housing from the latch assembly. (Fig. 7)
- (5) Disconnect the latch cable from the latch lever and remove the cable.

**Fig. 6 LATCH**

- 1 - LATCH GUIDE PLATE
- 2 - LATCH
- 3 - BOLTS (3)
- 4 - LIFTGATE

### INSTALLATION

- (1) Connect the latch cable to the latch and install the latch.
- (2) Install the guide plate and install the bolts.
- (3) Tighten the bolts to 16 N·m (12 ft. lbs.).
- (4) Verify liftgate latches are timed correctly. (Refer to 23 - BODY/LIFTGATE/LATCH - ADJUSTMENTS)
- (5) Install the insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - INSTALLATION)

80ec5015

**Fig. 7 LATCH/CABLE CONNECTION**

- 1 - LATCH CABLE
- 2 - RETAINER CLIP
- 3 - LATCH ASSEMBLY
- 4 - LATCH LEVER

## LATCH STRIKER

### REMOVAL

- (1) Open liftgate.
- (2) Remove bolts attaching striker to d-pillar (Fig. 8).
- (3) Separate striker from d-pillar.

80e6b379

**Fig. 8 LATCH STRIKER**

- 1 - BOLTS (2 PER SIDE)
- 2 - D-PILLAR
- 3 - STRIKER SHIM (IF EQUIPPED)
- 4 - STRIKER

## LATCH STRIKER (Continued)

## INSTALLATION

- (1) Position the striker on the d-pillar.
- (2) Install the bolts attaching the striker to the d-pillar and tighten to 28 N·m (20 ft. lbs.) (Fig. 8).
- (3) Install the tail lamp (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - INSTALLATION).
- (4) Verify the striker wedge and latch guide plate are correctly aligned and striker is positioned in the center of the latch fishmouth opening. (Fig. 6)

## LIFTGATE

## REMOVAL

**CAUTION:** Do not disconnect the support rod cylinders with the liftgate closed. The support rod pistons are operated by high pressure gas. This pressure could cause damage and /or personal injury if they are removed while the pistons are compressed.

- (1) Open and support the liftgate.
- (2) Remove the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL)
- (3) Remove the prop rods from the liftgate.
- (4) Disconnect the wire harnesses and the washer hose.
- (5) Using a grease pencil or equivalent, mark the hinge location.
- (6) Remove the liftgate to hinge screws and remove liftgate from vehicle. (Fig. 9)

Fig. 9 LIFTGATE

1 - HINGE  
2 - LIFTGATE

## INSTALLATION

- (1) Position the liftgate on the vehicle and align the witness marks.
- (2) Install the hinge screws at liftgate and tighten to 28 N·m (20 ft. lbs.).
- (3) Connect the wire harnesses and the washer hose.
- (4) Install the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - INSTALLATION)
- (5) Install the prop rods.
- (6) Close the liftgate and check for proper latching and alignment. Adjust as necessary. (Refer to 23 - BODY/LIFTGATE/LIFTGATE - ADJUSTMENTS)

## ADJUSTMENTS

**NOTE:** The position of the liftgate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use a body sealer on the hinge to body mating surface.

## In/out

- (1) Remove the upper liftgate trim. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL)
- (2) For the upper lift gate adjustments, loosen the hinge to header bolts and adjust to specifications (Fig. 4). (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (3) Tighten the hinge bolts to 28 N·m (20 ft. lbs.).
- (4) For the lower lift gate adjustments, loosen the striker screws and adjust to specifications (Fig. 8). (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the striker screws to 28 N·m (20 ft. lbs.).
- (6) Install the upper liftgate opening trim. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION)

## Up/Down and Left/Right

- (1) Loosen the hinge to liftgate bolts (Fig. 9).
- (2) Loosen the striker screws (Fig. 8).
- (3) Adjust the liftgate up/down position and tighten the hinge bolts to 28 N·m (20 ft. lbs.). (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (4) Confirm the lower liftgate in/out position and tighten the striker screws to 10 N·m (85 in. lbs.).

## TRIM PANEL

### REMOVAL

**NOTE:** The liftgate trim panel is attached with screws and clips.

- (1) Raise the liftgate.
- (2) Remove the screws securing the liftgate trim panel to the liftgate (Fig. 10).
- (3) Disconnect the rear window defroster wires.
- (4) Using a trim stick C-4755 or equivalent, pry the liftgate trim panel off the liftgate.

**Fig. 10 LIFTGATE TRIM PANEL**

1 - LIFTGATE  
2 - LIFTGATE TRIM PANEL

### INSTALLATION

**NOTE:** The liftgate trim panel is attached with screws and clips.

- (1) Align the liftgate trim panel spring clips and press the panel into the liftgate.
- (2) Install the trim panel screws.
- (3) Connect the rear defroster wires.

## LIFTGATE INSULATOR PAD

### REMOVAL

- (1) Remove the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL)
- (2) Separate the liftgate insulator from the liftgate and trim panel (Fig. 11).

**Fig. 11 LIFTGATE INSULATOR PAD**

1 - LIFTGATE  
2 - INSULATION PAD

### INSTALLATION

- (1) Thoroughly clean the area of any adhesive or insulation material.
- (2) Install the insulator in the liftgate.
- (3) Install the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - INSTALLATION)

80ba7980

80b46b0d

## LATCH - CONTROL ASSEMBLY

### REMOVAL

- (1) Remove the liftgate insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - REMOVAL)
- (2) Disconnect the electrical connector.
- (3) Disconnect the outside handle link from the latch. (Fig. 12)
- (4) Open the plastic retention clips and separate the latch cables from the control assembly.
- (5) Remove the three bolts and remove the control assembly. (Fig. 13)

80e8dc7d

**Fig. 12 LATCH CONTROL ASSEMBLY & HANDLE**

- 1 - LATCH CABLES (ADJUSTABLE)
- 2 - LATCH CABLE PLASTIC RETENTION CLIPS (CLIP SHOWN WITH COVER OPEN)
- 3 - LATCH ACTUATOR/POWER LOCK MOTOR (CAN BE SERVICE SEPARATELY)
- 4 - LATCH CONTROL ASSEMBLY METAL BRACKET
- 5 - MANUAL LOCK/UNLOCK LEVER MECHANISM
- 6 - LATCH ROD PLASTIC RETENTION CLIP (CLIP SHOWN WITH OPEN COVER)
- 7 - OUTSIDE LIFTGATE LATCH HANDLE (REAR VIEW)
- 8 - LATCH ROD (ADJUSTABLE)

### INSTALLATION

- (1) Install the control assembly.
- (2) Install the three bolts and tighten to 10 N·m (90 in. lbs.).
- (3) Connect the outside handle link.
- (4) Connect the latch cables.
- (5) Connect the electrical connector.
- (6) Adjust the outside handle. (Refer to 23 - BODY/LIFTGATE/LATCH - CONTROL ASSEMBLY - ADJUSTMENTS)

80ec51b4

**Fig. 13 LATCH FASTENERS**

- 1 - LATCH CONTROL ASSEMBLY
- 2 - BOLTS (3)

- (7) Adjust the latch cables. (Refer to 23 - BODY/LIFTGATE/LATCH - CABLE - ADJUSTMENTS)
- (8) Install the liftgate insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE - INSULATOR PAD - INSTALLATION)

## ADJUSTMENTS

### ADJUSTMENT

- (1) Remove the insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE - INSULATOR PAD - REMOVAL)
- (2) With the liftgate closed, slowly open the liftgate using the outside handle.
- (3) Determine if excessive handle travel is required to unlatch the liftgate. If so, adjustment to the latch rod may be required.
- (4) Open the liftgate.
- (5) Open the plastic latch rod retention clip on the outside handle and disconnect the latch rod from the outside handle. (Fig. 12)
- (6) Verify that the latch control assembly is in its fully returned position.

**NOTE: Do not pre-load the latch rod when attaching.**

- (7) Attach the threaded end of the latch rod to the open retention clip. Make sure all excess play has been removed between the outside liftgate handle and the latch assembly.

- (8) Fully close the plastic retention clip.
- (9) Cycle the outside handle and verify smooth operation.

- (10) Install the insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE - INSULATOR PAD - INSTALLATION)

## LATCH - CABLES

### REMOVAL

- (1) Remove the latch. (Refer to 23 - BODY/LIFTGATE/LATCH/GUIDE PLATE - REMOVAL)
- (2) Open the cable plastic retention clip. (Fig. 12)
- (3) Separate the cable from the control assembly. (Fig. 12)
- (4) Release the support clips, if equipped, and remove the cable.

### INSTALLATION

- (1) Install the cable and attach it to the latch.
- (2) Connect the cable to the control assembly and secure the retainer clips.
- (3) Attach the support clips if equipped.
- (4) Install the latch. (Refer to 23 - BODY/LIFTGATE/LATCH/GUIDE PLATE - INSTALLATION)
- (5) Adjust the cables. (Refer to 23 - BODY/LIFTGATE/LATCH - CABLES - ADJUSTMENTS)

## ADJUSTMENTS

### ADJUSTMENT

- (1) Remove the trim panel. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL)
- (2) With the liftgate closed, slowly open the liftgate using the outside handle.
- (3) Determine if one of more of the following occurs:
  - Excessive handle travel is required to unlatch the liftgate.
  - Only one side of the liftgate will unlatch.
  - As one side of the liftgate unlatches, more than 2 mm (0.08 in.) of additional outside handle travel is required to unlatch the other side (latches are not synchronized/timed).

**NOTE:** Do not close the liftgate during the adjustment procedure.

- (4) To adjust the latch cables, open the liftgate.
- (5) Open the plastic latch rod retention clip on the outside handle and disconnect the latch rod from the outside handle. (Fig. 12)
- (6) Open both latch cable retention clips and remove the threaded end of the cable from each clip.
- (7) Verify that the latch control assembly is in its fully returned position.
- (8) Verify that both latch cables slide smoothly and do not bind.

**NOTE:** The latches must be in their fully closed position to properly adjust the latch cables. The following step is necessary to remove excess cable play at the latch end of the cable.

- (9) Using a suitable tool, fully latch (close) both liftgate latches.
- (10) Gently pull on the latch cable threaded end to remove any excess play in the cable.
- (11) Remove the excess play from the other latch cable and seat both cable threaded ends into their respective opened retention clips.

**NOTE:** Apply a small bead of RTV to both open cable retention clips and threaded cable ends to prevent the threaded ends from rotating within the retention clips.

- (12) Close both cable retention clips. Verify complete clip closure.
- (13) Adjust the outside handle rod. (Refer to 23 - BODY/LIFTGATE/LATCH - ADJUSTMENTS)
- (14) While the liftgate is open and the latch control assembly is still uncovered, slowly open the outside latch handle to unlatch both side latches. Verify both latches unlatch.
- (15) Cycle the liftgate closed and open to verify correct operation of the liftgate latch system.
- (16) Install the insulator pad. (Refer to 23 - BODY/LIFTGATE/LIFTGATE INSULATOR PAD - INSTALLATION)

## CHECK STRAP

## REMOVAL

- (1) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)
- (2) Remove screws attaching door check to A-pillar.
- (3) Remove nuts attaching door check to door (Fig. 1).
- (4) Remove door check through speaker location hole.

## INSTALLATION

- (1) Position door check on door through speaker location hole (Fig. 1).
- (2) Install nuts attaching door check to door and tighten to 11 N·m (8 ft. lbs.).
- (3) Install screws attaching door check to a-pillar and tighten to 15 N·m (11 ft. lbs.).
- (4) Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)

Fig. 1 DOOR CHECK

- 1 - DOOR CHECK
- 2 - FRONT DOOR

## DOOR

### REMOVAL

- (1) Disconnect front door harness connector (Fig. 2).
- (2) Support door with padded floor jack.
- (3) Remove the check strap to body screws. (Refer to 23 - BODY/DOOR - FRONT/CHECK STRAP - REMOVAL)
- (4) Remove the four nuts from the door hinge studs. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
- (5) Separate door from vehicle.

**Fig. 2 FRONT DOOR HARNESS CONNECTOR**

- 1 - HARNESS CONNECTOR  
2 - DOOR

### INSTALLATION

- (1) Position door at vehicle and align hinges.
- (2) Install the hinge nuts. (Refer to 23 - BODY/DOOR - FRONT/HINGE - INSTALLATION)
- (3) Connect front door harness connector (Fig. 2).
- (4) Install the check strap to body screws. (Refer to 23 - BODY/DOOR - FRONT/CHECK STRAP - INSTALLATION)

## ADJUSTMENTS

### ADJUSTMENT

**NOTE:** For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

- During adjustment procedures, it is recommended that all the hinge fasteners be loosened

except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

- A suitable body sealant should be used when removing or moving the hinges.

### FORE/AFT

**NOTE:** Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
- (3) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (4) Tighten the hinge pillar fasteners to 28 N·m (21 ft. lbs.).

### UP/DOWN

**NOTE:** Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

**NOTE:** When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

**NOTE:** When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL) or loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).
- (4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the hinge pillar fasteners or the door to hinges fasteners to 28 N·m (21 ft. lbs.).

## DOOR (Continued)

(6) Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

## IN/OUT

**NOTE:** In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

**NOTE:** When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
- (4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the door to hinges fasteners to 28 N·m (21 ft. lbs.).
- (6) Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

## DOOR GLASS

## REMOVAL

- (1) Locate glass to half down position.
- (2) Remove the waterdam, (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (3) Remove inner belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL).
- (4) Using a long flat blade or hook type tool, disengage clips (Fig. 3) attaching glass liftplate to the regulator.
- (5) Carefully push bottom of glass panel outward to disengage glass retainer studs from lift plate (Fig. 4).
- (6) Lift glass upward and out of door.

## INSTALLATION

- (1) Lower glass into position.
- (2) Carefully align glass lift plate studs with regulator lift plate and insert studs into lift plate.
- (3) Engage clips attaching glass lift plate to regulator lift plate.

**Fig. 3 FRONT DOOR GLASS CLIPS**

- 1 - GLASS
- 2 - GLASS LIFT PLATE
- 3 - CLIP
- 4 - REGULATOR LIFT PLATE
- 5 - REGULATOR
- 6 - CLIP

**Fig. 4 FRONT DOOR GLASS RETAINER**

- 1 - GLASS
- 2 - GLASS LIFT PLATE
- 3 - REGULATOR LIFT PLATE
- 4 - STUD

- (4) Install inner belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION).
- (5) Install waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)

## EXTERIOR HANDLE

### REMOVAL

- (1) Raise the glass to the full up position and remove glass run channel. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - REMOVAL).
- (2) For the drivers door, disconnect lock cylinder to latch rod.
- (3) Disconnect exterior handle to latch rod
- (4) Remove fasteners attaching outside handle to door (Fig. 5).
- (5) Remove outside handle from door.
- (6) Disconnect anti-theft harness connector, if equipped.
- (7) Separate outside handle from vehicle.

80b3c6f7

**Fig. 5 FRONT DOOR OUTSIDE HANDLE**

- 1 - DOOR  
2 - OUTSIDE HANDLE

### INSTALLATION

- (1) Position exterior handle at door (Fig. 5).
- (2) Connect anti-theft harness connector, if equipped.
- (3) Position the handle on the door and slide fully toward the rear of the door.
- (4) Install nuts attaching exterior handle to door and tighten to 6 N·m (55 in. lbs.).
- (5) For the drivers door, install the screws attaching the key cylinder screws bracket and tighten to 6 N·m (55 in. lbs.).
- (6) Connect exterior handle to latch rod
- (7) For the drivers door, connect lock cylinder to latch rod.

- (8) Install glass run channel. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION)

## GLASS RUN CHANNEL

### REMOVAL

**NOTE:** Only the rearward glass run channel is serviceable.

- (1) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)
- (2) Remove bolt attaching run channel to inner door panel (Fig. 6).
- (3) Peel back glass run channel weatherstrip on rear run channel.
- (4) Pull glass run channel downward to separate from door.
- (5) Remove glass run channel from door.

80b46b3b

**Fig. 6 FRONT DOOR GLASS RUN CHANNEL**

- 1 - DOOR  
2 - GLASS  
3 - GLASS RUN CHANNEL  
4 - REGULATOR

### INSTALLATION

- (1) Position glass run channel in door (Fig. 6).
- (2) Align glass run channel with door frame run channel and slide channel upward to secure door.
- (3) Press glass run channel weatherstrip into rear run channel.
- (4) Install bolt attaching run channel to inner door panel.
- (5) Install the waterdam, (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

## HINGE

## REMOVAL

**NOTE:** The hinges may be removed and replaced one at a time to make the door fit adjustment easier.

(1) Open and support door with a suitable lifting device.

(2) Using a grease pencil or equivalent, mark the hinge location.

(3) Disconnect the door wire harness.

(4) If replacing both hinges at the same time, remove the bolts and disconnect the door check from the a-pillar. (Fig. 7)

**NOTE:** The epoxy coated washers should not be removed from the hinges. If the washers are removed the door may have to be re-adjusted.

(5) Remove the door hinge to the door nuts. (Fig. 8)

(6) If replacing both hinges at the same time, remove the door.

(7) Remove the bolts and remove the hinge from the a-pillar.

**Fig. 7 FRONT DOOR CHECK**

- 1 - DOOR CHECK
- 2 - FRONT DOOR

**Fig. 8 Front Door Hinges**

- 1 - WASHER
- 2 - UPPER HINGE
- 3 - FRONT DOOR
- 4 - LOWER HINGE
- 5 - WASHER

## INSTALLATION

**NOTE:** Use 3M® Fast and Firm or equivalent on the hinge to body mating surface as a sealant.

(1) Position hinge on a-pillar.

(2) Install hinge to body bolts, but do not tighten.

(3) Align the hinge to the reference marks and torque the bolts to 28 N·m (21 ft. lbs.).

(4) Install the door on the hinge and align with the reference marks.

(5) Install the nuts and washers and tighten 31 N·m (23 ft. lbs.). (Fig. 8)

(6) Check and adjust the door position if necessary. (Refer to 23 - BODY/DOOR - FRONT/DOOR - ADJUSTMENTS)

## INSIDE HANDLE ACTUATOR

### REMOVAL

- (1) Remove the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove screws attaching inside handle actuator to trim panel (Fig. 9).
- (3) Separate inside handle actuator from trim panel.

**Fig. 9 FRONT DOOR INSIDE HANDLE ACTUATOR**

- 1 - INSIDE HANDLE ACTUATOR
- 2 - DRIVER'S DOOR TRIM PANEL
- 3 - SCREW

### INSTALLATION

- (1) Position inside handle actuator in trim panel.
- (2) Install screws attaching inside handle actuator to trim panel (Fig. 9).
- (3) Install the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

## LATCH

### REMOVAL

- (1) Remove glass run channel. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - REMOVAL)

- (2) Remove screws attaching door latch to door (Fig. 10).
- (3) Disconnect all rods from door latch.
- (4) Disconnect wire harness connector.
- (5) Separate door latch from door.

**Fig. 10 DOOR LATCH**

- 1 - DOOR
- 2 - LATCH
- 3 - ISOLATOR

### INSTALLATION

- (1) Position door latch at door.
- (2) Connect wire harness connector.
- (3) Connect all rods to door latch.
- (4) Install screws attaching door latch to door and tighten to 11 N·m (8 ft. lbs.). (Fig. 10)
- (5) Install glass run channel. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION)
- (6) Adjust the latch. (Refer to 23 - BODY/DOOR - FRONT/LATCH - ADJUSTMENTS)

## LATCH (Continued)

## ADJUSTMENTS

## ADJUSTMENT

- (1) Locate access hole and remove the mylar tape covering it. (Fig. 11)
- (2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
- (3) Operate outside handle several times to release any restriction because of mis-alignment.
- (4) Tighten adjustment screw to 3 N·m (30 in. lbs.).
- (5) Test handle for proper operation.

**Fig. 11 LATCH ADJUSTMENT SCREW - TYPICAL**

- 1 - DOOR LATCH
- 2 - MYLAR TAPE
- 3 - ADJUSTMENT SCREW

## LATCH STRIKER

## REMOVAL

- (1) Remove screws attaching striker to b-pillar.
- (2) Separate striker and spacer from b-pillar (Fig. 12).

## INSTALLATION

- (1) Position striker and spacer on b-pillar.
- (2) Install screws attaching striker to b-pillar and tighten to 28 N·m (21 ft. lbs.). (Fig. 12)

## LOCK CYLINDER

## REMOVAL

- (1) Remove exterior handle. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL)
- (2) Remove screw securing lock cylinder retainer to outside door handle (Fig. 13).
- (3) Separate lock cylinder from door handle.
- (4) Disconnect lock cylinder switch, if equipped.

**Fig. 12 FRONT DOOR LATCH STRIKER**

- 1 - B-PILLAR
- 2 - SPACER
- 3 - STRIKER

**Fig. 13 FRONT DOOR LOCK CYLINDER**

- 1 - OUTSIDE DOOR HANDLE
- 2 - LOCK CYLINDER
- 3 - SCREW

## INSTALLATION

- (1) Connect lock cylinder switch, if equipped.
- (2) Position lock cylinder in door handle.
- (3) Position lock cylinder retainer and install screw (Fig. 13).
- (4) Install exterior handle. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION)

## TRIM PANEL

### REMOVAL

- (1) Remove trim plug from mirror flag bezel.
- (2) Remove three screws attaching trim panel to door (Fig. 14).
- (3) Using a trim stick C-4829 or equivalent, detach trim panel perimeter push-in fasteners from door inner panel.
- (4) Lift trim panel upward and separate from door.
- (5) Disconnect latch rods from inside handle actuator.
- (6) Disconnect harness connectors for power accessories.
- (7) Separate trim panel from vehicle.

**Fig. 14 FRONT DOOR TRIM PANEL**

- 1 - HARNESS CONNECTOR
- 2 - NUTSERT
- 3 - TRIM PLUG
- 4 - TRIM PANEL
- 5 - PUSH-IN FASTENER
- 6 - HARNESS CONNECTOR
- 7 - LATCH RODS

### INSTALLATION

- (1) Connect harness connectors to power accessories.
- (2) Connect latch rods to inside handle actuator.
- (3) Position trim panel on door inner panel.
- (4) Press trim panel push-in fasteners inward around perimeter of door.
- (5) Install screws attaching trim panel to door (Fig. 14).
- (6) Install trim plug in mirror flag bezel.

## WATERDAM

### REMOVAL

- (1) Remove the door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)
- (2) Peel the waterdam from door.
- (3) Route all harnesses and linkage rods through waterdam as necessary.
- (4) Separate waterdam from door (Fig. 15).

80b46b2f

**Fig. 15 FRONT DOOR WATERDAM**

1 - INSULATOR PAD/WATERDAM

### INSTALLATION

- (1) Using MOPAR® Super Kleen solvent or equivalent, clean the waterdam contact surface of contaminants.
- (2) Route all harnesses and linkage rods through waterdam as necessary.
- (3) Position waterdam on door and align all holes.
- (4) Press waterdam on door (Fig. 15).
- (5) Install the door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)

## WINDOW REGULATOR

### REMOVAL

(1) Remove the waterdam, (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Using a long flat blade or hook type tool, disengage clips attaching glass liftplate to the regulator, (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).

(3) Secure glass in up position using a wood wedge, tape, or equivalent.

(4) Loosen the regulator bolts located at the key-hole slots in the inner door panel (Fig. 16).

(5) Remove the remaining bolts attaching regulator to inner door panel.

(6) Disengage power window regulator harness connector, if equipped.

(7) Lift regulator upward to disengage bolts from door inner panel (Fig. 17).

(8) Remove regulator through access hole in door.

**Fig. 17 FRONT DOOR WINDOW REGULATOR**

- 1 - FRONT DOOR
- 2 - REGULATOR PIGTAIL
- 3 - REGULATOR
- 4 - PIGTAIL WIRING PASS THROUGH HOLE

**Fig. 16 FRONT DOOR REGULATOR BOLTS**

- 1 - FRONT DOOR
- 2 - REMOVE BOLT
- 3 - LOOSEN BOLTS
- 4 - REGULATOR WIRING PIGTAIL

### INSTALLATION

(1) Position regulator in door through access hole.

(2) Lift regulator upward and engage bolts in door inner panel key hole slots.

(3) Route the regulator wiring pigtail through the hole in the inner panel and connect, if equipped.

(4) Install bolt attaching regulator to inner door panel.

(5) Tighten bolts attaching regulator to inner door panel to 9 N·m (80 in. lbs.).

(6) Remove glass support and then position glass lift plate to regulator lift plate.

(7) Engage clips attaching glass lift plate to regulator lift plate, (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION).

(8) Install waterdam, (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

## CHECK STRAP

## REMOVAL

- (1) Remove waterdam.(Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)
- (2) Remove screws attaching door check to b-pillar.
- (3) Remove nuts attaching door check to door (Fig. 1).
- (4) Remove door check through speaker location hole.

## INSTALLATION

- (1) Position door check on door through speaker location hole.
- (2) Install nuts attaching door check to door and tighten to 11 N·m (8 ft. lbs.). (Fig. 1)
- (3) Install screws attaching door check to b-pillar and tighten to 15 N·m (11 ft. lbs.).
- (4) Install waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

Fig. 1 DOOR CHECK

- 1 - DOOR CHECK
- 2 - REAR DOOR

## DOOR

### REMOVAL

- (1) Disconnect rear door harness connector (Fig. 2).
- (2) Support door with suitable lifting device.
- (3) Remove the check strap screws to the b-pillar. (Refer to 23 - BODY/DOORS - REAR/CHECK STRAP - REMOVAL)
- (4) Remove the four nuts from the door hinge studs. (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL)
- (5) Separate door from vehicle.

80b5cb4c

**Fig. 2 REAR DOOR HARNESS CONNECTOR**

1 - HARNESS CONNECTOR

### INSTALLATION

- (1) Position door at vehicle and align hinges.
- (2) Install the hinge nuts. (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)
- (3) Install the check strap to body screws. (Refer to 23 - BODY/DOORS - REAR/CHECK STRAP - INSTALLATION)
- (4) Connect rear door harness connector (Fig. 2).

## ADJUSTMENTS

### ADJUSTMENT

**NOTE:** For vehicles equipped with four doors, it is recommended that you adjust the rear door before adjusting the front door.

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper fasteners to hold the

door with final torque of the fasteners occurring after correct door positioning is achieved.

### FORE/AFT

**NOTE:** Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL)
- (3) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (4) Tighten to hinge pillar fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)

**NOTE:** Use a suitable body sealer on the hinge to body mating surfaces.

### UP/DOWN

**NOTE:** Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

**NOTE:** When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

**NOTE:** When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL) or loosen the hinge to door fasteners (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL).
- (4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten to hinge pillar fasteners or the door to hinges fasteners and fasteners to 28 N·m (21 ft. lbs.).

## DOOR (Continued)

(Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)

(6) Tighten the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

## IN/OUT

**NOTE:** In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

**NOTE:** When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
- (4) Adjust the front of the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the door to hinges fasteners to 28 N·m (21 ft. lbs.).
- (6) Tighten the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

## DOOR GLASS

## REMOVAL

- (1) Remove stationary glass. (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - REMOVAL)
- (2) Disengage clips attaching window glass to lift plate.
- (3) Press studs out of lift plate.
- (4) Lift window glass from door (Fig. 3).

## INSTALLATION

- (1) Position window glass in door (Fig. 3).
- (2) Engage clips attaching window glass to lift plate.
- (3) Engage studs into lift plate.
- (4) Install stationary glass. (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - INSTALLATION)

## EXTERIOR HANDLE

## REMOVAL

- (1) Remove waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)

80b46b1f

Fig. 3 GLASS CHANNEL

- 1 - GLASS
- 2 - REGULATOR

- (2) Disconnect exterior handle to latch rod.
- (3) Remove fasteners attaching exterior handle to door (Fig. 4).
- (4) Remove exterior handle from door.
- (5) Separate exterior handle from vehicle.

80b46a1c

Fig. 4 FRONT

- 1 - DOOR
- 2 - OUTSIDE HANDLE

## INSTALLATION

- (1) Position exterior handle in door.
- (2) Install fasteners attaching exterior handle to door (Fig. 4).
- (3) Connect exterior handle to latch rod.
- (4) Install waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

## HINGE

### REMOVAL

**NOTE:** The hinges may be removed and replaced one at a time to make the door fit adjustment easier.

- (1) Open front door and rear door.
- (2) Using a grease pencil or equivalent, mark hinges for installation (Fig. 5).
- (3) Support rear door with suitable lifting device.
- (4) If replacing both hinges at the same time, disconnect rear door harness connector (Fig. 2).
- (5) If replacing both hinges at the same time, remove the bolts and disconnect the door check from the b-pillar. (Refer to 23 - BODY/DOORS - REAR/CHECK STRAP - REMOVAL)
- (6) Remove the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

**NOTE:** The epoxy coated washers should not be removed from the hinges. If the washers are removed the door may have to be re-adjusted.

- (7) Remove nuts holding door to hinge and remove the door.
- (8) Remove the two outside bolts and the one inside bolt holding hinge to b-pillar.

**Fig. 5 Rear Door Hinge**

- 1 - UPPER HINGE
- 2 - WASHER
- 3 - WASHER
- 4 - LOWER HINGE
- 5 - REAR DOOR

### INSTALLATION

**NOTE:** Use 3M® Fast and Firm or equivalent on the hinge to body mating surface as a sealant.

- (1) Install hinge on b-pillar and align reference marks (Fig. 5).
- (2) Install bolts holding hinge to b-pillar and tighten to 28N·m (21 ft. lbs.).
- (3) Install door on hinge and align reference marks.
- (4) Install nuts, the epoxy washers if necessary, and tighten to 31 N·m (23 ft. lbs.).
- (5) Check door for fit and ease of operation. Adjust as necessary, refer to (Refer to 23 - BODY/DOOR - FRONT/DOOR - ADJUSTMENTS).
- (6) Install the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

## INSIDE HANDLE ACTUATOR

### REMOVAL

- (1) Remove the trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Disconnect latch and lock rods from inside handle actuator.
- (3) Remove screws attaching inside handle actuator to trim panel (Fig. 6).
- (4) Separate inside handle actuator from trim panel.

**Fig. 6 REAR DOOR INSIDE HANDLE ACTUATOR**

- 1 - REAR DOOR TRIM PANEL
- 2 - SCREW
- 3 - INSIDE HANDLE ACTUATOR

### INSTALLATION

- (1) Position inside handle actuator in trim panel.
- (2) Install screws attaching inside handle actuator to trim panel (Fig. 6).
- (3) Connect latch and lock rods to inside handle actuator.

## INSIDE HANDLE ACTUATOR (Continued)

(4) Install door trim panel, refer to (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

## LATCH

## REMOVAL

(1) Remove waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).

(2) Remove screws attaching latch to door (Fig. 7).

(3) Disconnect the electrical harness connector.

(4) Disconnect rods from door latch.

(5) Separate door latch from door.

**Fig. 7 REAR DOOR LATCH**

- 1 - DOOR
- 2 - LATCH
- 3 - OUTSIDE HANDLE

## INSTALLATION

(1) Connect the electrical harness electrical connector and position the latch in door.

(2) Connect rods to door latch.

(3) Install screws attaching latch to door and tighten to 11 N·m (8 ft. lbs.). (Fig. 7)

(4) Install waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).

(5) Verify proper power lock and ajar switch operation.

## ADJUSTMENTS

## ADJUSTMENT

(1) Locate access hole and remove the mylar tape covering it. (Fig. 8)

(2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.

(3) Operate outside handle several times to release any restriction because of mis-alignment.

(4) Tighten adjustment screw to 3 N·m (30 in. lbs.).

(5) Test handle for proper operation.

**Fig. 8 LATCH ADJUSTMENT SCREW - TYPICAL**

- 1 - DOOR LATCH
- 2 - MYLAR TAPE
- 3 - ADJUSTMENT SCREW

## LATCH STRIKER

### REMOVAL

- (1) Remove screws attaching striker to C-pillar (Fig. 9).
- (2) Separate striker and spacer from vehicle.

**Fig. 9 REAR DOOR LATCH STRIKER**

- 1 - TAPPING PLATE
- 2 - SPACER
- 3 - STRIKER

### INSTALLATION

- (1) Position striker and spacer on C-pillar.
- (2) Install screws and tighten to 28 N·m (21 ft. lbs.).
- (3) Check door fit and adjust striker as necessary. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

## TRIM PANEL

### REMOVAL

- (1) Remove screws attaching trim panel to door (Fig. 10).
- (2) Using a trim stick C-4829 or equivalent, detach trim panel perimeter push-in fasteners from door inner panel.
- (3) Lift trim panel upward and separate from door.
- (4) Disconnect latch rods from inside handle actuator.
- (5) Disconnect harness connectors for power accessories.
- (6) Separate trim panel from vehicle.

**Fig. 10 REAR DOOR TRIM PANEL**

- 1 - TRIM PANEL
- 2 - NUTSERT
- 3 - HARNESS CONNECTOR
- 4 - LATCH RODS

### INSTALLATION

- (1) Connect harness connectors to power accessories.
- (2) Connect latch rods to inside handle actuator.
- (3) Position trim panel on door inner panel.
- (4) Press trim panel push-in fasteners inward around perimeter of door.
- (5) Install screws attaching trim panel to door (Fig. 10).

## WATERDAM

### REMOVAL

- (1) Remove the door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)
- (2) Peel the waterdam from door.
- (3) Route all harnesses and linkage rods through waterdam as necessary.
- (4) Separate waterdam from door (Fig. 11).

80b46b0f

**Fig. 11 REAR DOOR WATERDAM**

1 - INSULATOR PAD

### INSTALLATION

- (1) Waterdam contact surface must be free of contaminants. Clean as necessary.
- (2) Route all harnesses and linkage rods through waterdam as necessary.
- (3) Position waterdam on door and align all holes (Fig. 11).
- (4) Press waterdam on door.
- (5) Install the door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)

## WINDOW REGULATOR

### REMOVAL

- (1) Remove the waterdam, (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Using a long flat blade or hook type tool, disengage clips attaching glass liftplate to the regulator (Fig. 12).
- (3) Secure glass in up position using a wood wedge, tape, or equivalent.
- (4) Remove the fasteners retaining the regulator (Fig. 13).
- (5) Disconnect the electrical harness from the regulator pigtail.
- (6) Remove the regulator.

### INSTALLATION

- (1) Position the window regulator in the door.

80b4fb30

80b3c6f8

**Fig. 13 REAR DOOR WINDOW REGULATOR**

- 1 - DOOR
- 2 - REGULATOR

- (2) Install the fasteners retaining the regulator and tighten to 9 N·m (80 in. lbs.) (Fig. 13).
- (3) Connect the electrical harness and regulator pigtail connector.
- (4) Remove glass support and then position glass lift plate to regulator lift plate.
- (5) Engage clips attaching glass lift plate to regulator lift plate, (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION).
- (6) Install waterdam, (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).
- (7) Cycle the glass and check for proper operation.

## BODY SIDE MOLDINGS

## REMOVAL

## Doors

- (1) Open the door.
- (2) Using a trim stick C-4755 or equivalent, pry the upper rear edge off the door. Continue to the front edge of the front door. (Fig. 1) and (Fig. 2).
- (3) Using a heat gun, warm the adhesive tape on the lower edge of the cladding and pull the cladding from the door.

Fig. 1 FRONT DOOR CLADDING

1 - CLADDING

## BODY SIDE MOLDINGS (Continued)

**Fig. 2 REAR DOOR CLADDING**

1 - CLADDING

**Fender/Quarter Panel**

- (1) Remove the screws at wheel opening (Fig. 3).
- (2) Using a trim stick C-4755 or equivalent, gently pry bottom of cladding up.
- (3) Lift upwards and remove cladding.

**Fig. 3 FRONT FENDER/ QUARTER PANEL**

1 - SCREW  
 2 - QUARTER PANEL CLADDING  
 3 - FRONT FENDER CLADDING  
 4 - SCREW

**INSTALLATION****Doors**

- (1) Clean the area thoroughly with MOPAR® Super Kleen, or equivalent.

- (2) Align the body side cladding with the slots in the door. Press the adhesive pad to the door and snap the retainers into the slots.

**Fender/Quarter Panel**

- (1) Thoroughly clean the area with MOPAR® Super Kleen, or equivalent.
- (2) Align the cladding with the screw holes in the fender.
- (3) Press the cladding in place.
- (4) Install the screws at the wheel opening.

**COWL GRILLE****REMOVAL**

- (1) Remove wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
- (2) Remove plenum seal.
- (3) Remove plastic push nuts attaching cowl cover to cowl (Fig. 4).
- (4) Remove windshield washer tubes at connector.
- (5) Remove cowl cover from cowl.

**Fig. 4 COWL COVER**

1 - PLASTIC NUT  
 2 - COWL COVER

**INSTALLATION**

- (1) Position cowl cover on cowl.
- (2) Install windshield washer tubes at connector.
- (3) Install plastic push nuts attaching cowl cover to cowl (Fig. 4).
- (4) Install plenum seal.
- (5) Install windshield wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)

## D-PILLAR APPLIQUE

### REMOVAL

(1) Using a trim stick C-4755 or equivalent, carefully pry applique from panel (Fig. 5).

**Fig. 5 D - PILLAR APPLIQUE & AIR EXHAUSTER**

- 1 - D - PILLAR EXHAUSTER
- 2 - D - PILLAR APPLIQUE
- 3 - CLIP
- 4 - TAIL LAMP EXHAUSTER

### INSTALLATION

- (1) Position applique on panel with retainers aligned.
- (2) Press applique firmly in place.

## EXHAUSTER - RIGHT D-PILLAR

### REMOVAL

- (1) Remove D-pillar applique. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - REMOVAL)
- (2) Carefully pry air exhauster from D-pillar using a flat blade screwdriver (Fig. 5).

### INSTALLATION

- (1) Reseal air exhauster using foam tape.
- (2) Install air exhauster on D-pillar.
- (3) Install D-pillar applique. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - INSTALLATION)

## EXHAUSTER - TAIL LAMP

### REMOVAL

- (1) Remove tail lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - REMOVAL)
- (2) Using a trim stick C-4755 or equivalent, pry the top of the air exhauster downward to detach the retaining clips.

- (3) Separate air exhauster from vehicle (Fig. 5).

### INSTALLATION

- (1) Position air exhauster in opening.
- (2) Press air exhauster inward to secure.
- (3) Install tail lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - INSTALLATION)

## EXHAUSTER - LEFT QUARTER PANEL

### REMOVAL

- (1) Remove the rear fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL)
- (2) Using a trim stick C-4755 or equivalent, pry air exhauster from panel.

### INSTALLATION

- (1) Using a foam tape, reseal the air exhauster.
- (2) Install the exhauster onto the quarter panel.
- (3) Install the rear fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION)

## EXTERIOR NAME PLATES

### REMOVAL

**NOTE:** Exterior nameplates are attached to body panels with adhesive tape.

- (1) Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.
- (2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.
- (3) Using a trim stick C-4755 or a hard wood wedge behind the emblem to separate the adhesive backing from the body.
- (4) Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

### INSTALLATION

- (1) Remove protective cover from adhesive tape on back of emblem.
- (2) Position emblem properly on body.
- (3) Press emblem firmly to body with palm of hand.
- (4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

## FRONT FENDER

### REMOVAL

- (1) Using a grease pencil or equivalent, mark position of fender.
- (2) Remove front fender liner.
- (3) Pull back fascia and remove screws attaching fender to fascia.
- (4) Remove screws attaching lower fender bracket located behind fascia.
- (5) Remove screws attaching fender to rocker panel (Fig. 6).
- (6) Remove screws attaching rear of fender to A-pillar brackets.
- (7) Open hood.
- (8) Loosen screw under hood hinge, attaching fender to engine compartment rail.
- (9) Remove screws attaching fender to engine compartment rail (Fig. 7).
- (10) Right fender only:
  - (a) If equipped, remove radio antenna. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - REMOVAL)
- (11) Separate fender from body.

80b3c70d

**Fig. 7 UPPER FENDER MOUNTING**

1 - FENDER  
2 - BODY

**Fig. 6 FENDER MOUNTING**

80b34e99

1 - BODY

2 - FENDER

## FRONT FENDER (Continued)

**INSTALLATION**

- (1) Position fender on body.
- (2) If equipped, install radio antenna. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - INSTALLATION)
- (3) Install all screws finger-tight.
- (4) Align fender with adjacent body panels and reference marks. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten all screws to 12 N·m (9 ft. lbs.).
- (6) Install inner fender liner.

**FUEL FILL DOOR****REMOVAL**

- (1) Open the fuel filler door.
- (2) Remove the screws attaching the door to the quarter panel (Fig. 8).
- (3) Remove the door from the panel.

80b46ae3

**Fig. 8 FUEL FILLER DOOR**

1 - FUEL FILL DOOR

**INSTALLATION**

- (1) Position the fuel filler door on the quarter panel with the screw holes aligned.
- (2) Install the screws attaching the fuel filler door to the quarter panel and tighten to 9 N·m (80 in. lbs.).

**GRILLE****REMOVAL****REMOVAL**

- (1) Using a trim stick C-4755 or equivalent, separate the top of the grille by releasing the five upper clips.

- (2) Roll the grille forward and release the four lower retaining tabs and remove the grille. (Fig. 9)

8106d5ae

**Fig. 9 GRILLE**

- 1 - LOWER RETAINING TABS (4)
- 2 - GRILLE
- 3 - UPPER RETAINING CLIPS (5)

**REMOVAL - EXPORT**

- (1) Remove fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL - EXPORT)
- (2) Disengage retainers attaching grille insert to grille/fascia.
- (3) Separate grille insert from grille/fascia (Fig. 10).

80b6b1f5

**Fig. 10 Grille Insert - Export**

- 1 - GRILLE/FASCIA
- 2 - INSERT

**INSTALLATION****INSTALLATION**

- (1) Position the grille onto the fascia and engage the lower retaining tabs. (Fig. 9)

## GRILLE (Continued)

(2) Rotate the grille up and engage the upper retaining clips beginning at the center and moving outward.

**INSTALLATION - EXPORT**

- (1) Position grille insert in grille/fascia (Fig. 10).
- (2) Engage retainers attaching grille insert to grille/fascia.
- (3) Install fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION - EXPORT)

**HEADLAMP MOUNTING MODULE (HMM)****REMOVAL**

**CAUTION:** Take special care when handling the Headlight Mounting Module (HMM) not to damage the upper mounting tabs. Step #3 must be performed prior to removing HMM from the vehicle to prevent damage to HMM.

- (1) Remove fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

- (2) Remove inner fender liner.
- (3) Reach into the wheelhouse opening and disengage the retainer attaching the HMM to each side of the body.
- (4) Remove bolts attaching headlamp mounting module to body (Fig. 11).
- (5) Disconnect headlamp wire harness connectors.
- (6) Separate headlamp mounting module from vehicle.

**INSTALLATION**

- (1) Position headlamp mounting module (HMM) at vehicle.
- (2) Connect headlamp wire harness connectors.
- (3) Engage the retainer attaching the HMM to each side of the body.
- (4) Install bolts attaching headlamp mounting module to body and tighten to 6 Nm (55 in. lbs.). (Fig. 11)
- (5) Install inner fender liner.
- (6) Install front fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

80b46cd0

**Fig. 11 HEADLAMP MOUNTING MODULE**

1 - CONNECTOR  
2 - CONNECTOR

3 - MOUNTING BRACKET  
4 - HEADLAMP MODULE

## LUGGAGE RACK

### REMOVAL

**NOTE:** The skid strips are attached to the roof panel with adhesive.

- (1) Using a trim stick C-4755 or equivalent, pry support cover off.
- (2) If necessary, slide the crossbars to expose the screws attaching the slide rails to the supports.
- (3) Remove the screws retaining the slide rails to the supports.
- (4) Remove the screws attaching the supports to the roof panel.
- (5) Separate the supports from the roof panel.

**NOTE:** If a crossbar needs to be serviced, the forward or rearward supports will have to be removed.

### INSTALLATION

- (1) Position the supports on the roof panel and install the screw. Be sure that the gasket is properly seated.
- (2) Position the luggage rack on the supports.
- (3) Install the screws attaching the side rails to the supports.
- (4) Position the supports covers on the supports and press into place.

## SIDE VIEW MIRROR GLASS

### REMOVAL

**WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.**

- (1) Carefully pull/pry the broken glass holder from the mirror assembly.
- (2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

### INSTALLATION

**CAUTION:** It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

- (1) Position the new mirror glass holder to the mirror assembly.

**NOTE:** Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

- (2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

**NOTE:** Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

- (3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

**NOTE:** Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

- (4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

## SIDE VIEW MIRROR

### REMOVAL

- (1) Remove door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Disengage power mirror harness connector, if equipped.
- (3) Remove mirror flag seal.
- (4) Remove nuts attaching mirror to door (Fig. 12).
- (5) Separate mirror from door.

**Fig. 12 SIDE VIEW MIRROR**

- 1 - SIDEVIEW MIRROR
- 2 - MIRROR FLAG SEAL
- 3 - CONNECTOR

80b46ae4

## SIDE VIEW MIRROR (Continued)

## INSTALLATION

- (1) Position mirror on door. Verify that gasket seal is properly positioned.
- (2) Install nuts attaching mirror to door (Fig. 12).
- (3) Install mirror retaining nuts and tighten to 7 N·m (60 in. lbs.).
- (4) Install mirror flag seal.
- (5) Engage power mirror harness connector, if equipped.
- (6) Install door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## ROCK RAIL

## REMOVAL

- (1) Remove the bolts and remove the rock rail. (Fig. 13)

80cf181b

**Fig. 13 ROCK RAIL**

- 1 - ROCK RAIL
- 2 - J-NUTS (3)
- 3 - J-NUTS (3)
- 4 - BOLTS (3)
- 5 - BOLTS (3)

## INSTALLATION

**NOTE:** Shims may be used to adjust rock rail positioning, if required.

- (1) Loosen the rear bracket slide bolts. (Fig. 14)
- (2) Install the rock rail and install the bolts.
- (3) Tighten the front bolts to 27 N·m (20 ft. lbs.).
- (4) Slide the rear bracket to contact the mounting surface and tighten the rear mounting bolts to 27 N·m (20 ft. lbs.).
- (5) Tighten the slide bolts to 27 N·m (20 ft. lbs.).
- (6) Loosen the end cap bolts and slide the end caps against the body.
- (7) Tighten the end cap bolts.

80d9398a

**Fig. 14 REAR ROCK RAIL BRACKET**

## GAS PROP

## REMOVAL

- (1) Raise and support hood.
- (2) Using a small flat blade, pry the retainer attaching hood support prop to lower ball stud.
- (3) Slide retainer attaching hood support prop upper ball stud downward.
- (4) Disconnect hood support prop from lower ball stud and rotate support prop upward and disconnect from upper ball stud (Fig. 1).

80b3c6fc

Fig. 1 HOOD SUPPORT PROP

- 1 - HOOD  
2 - COVER  
3 - HINGE  
4 - PROP

## INSTALLATION

- (1) Position hood support prop on upper ball stud (Fig. 1).
- (2) Slide retainer upward to secure support prop to upper ball stud.

- (3) Position support prop on lower ball stud and press retainer inward to secure.

## HINGE

## REMOVAL

**NOTE:** It is not necessary to remove the hood to replace one or both hinges. The hinges can be replaces one at a time.

- (1) Raise and support hood.
- (2) Using a grease pencil or equivalent, mark the position of the hinge.
- (3) Remove the hood hinge gas prop. (Refer to 23 - BODY/HOOD/GAS PROP - REMOVAL)
- (4) Remove thenuts attaching hinge to hood (Fig. 1).
- (5) Remove the bolts attaching hinge to body.
- (6) Separate the hinge from vehicle.

## INSTALLATION

- (1) Position hinge on vehicle and align reference marks.
- (2) Install bolts attaching hinge to body and tighten to 12 N·m (9 ft. lbs.).
- (3) Install nuts attaching hinge to hood and tighten to 12 N·m (9 ft. lbs.).
- (4) Install hood hinge prop rod. (Refer to 23 - BODY/HOOD/GAS PROP - INSTALLATION)
- (5) Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

## HOOD

### REMOVAL

- (1) Raise and support the hood.
- (2) If equipped, disconnect underhood lamp harness connector. (Connector is located under cowl cover).
- (3) Using a grease pencil or equivalent, mark location of hood hinges on hood for installation alignment.
- (4) Remove hood gas props. (Refer to 23 - BODY/HOOD/GAS PROP - REMOVAL)
- (5) Remove bolts attaching hinges to hood.
- (6) With the aid of a helper, remove hood from vehicle.

### INSTALLATION

- (1) Position hood on hinges.
- (2) Install bolts finger-tight.
- (3) Align hinges with installation reference marks and tighten bolts 12 N·m (9 ft. lbs.).
- (4) Install hood gas props. (Refer to 23 - BODY/HOOD/GAS PROP - INSTALLATION)
- (5) Connect underhood lamp connector.
- (6) Inspect hood for proper alignment and adjust as necessary. (Refer to 23 - BODY/HOOD/HOOD - ADJUSTMENTS)

## ADJUSTMENTS

### HOOD ADJUSTMENT

**NOTE:** The hood attaching holes are enlarged to aid front, back and side to side adjustment.

- (1) Check the hood alignment. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (2) If hood is low in relation to cowl panel, insert shims between hinge and hood.
- (3) Adjust hood bumper in or out to adjust hood-to-fender height alignment.
- (4) Adjust the hood latch as necessary. Tighten the nuts to 11N·m (8 ft. lbs.).
- (5) Align the latch striker so that striker enters the latch squarely and without binding.

## INSULATION

### REMOVAL

- (1) Raise the hood.
- (2) Remove the insulation panel fasteners.
- (3) Remove the hood insulation panel.

### INSTALLATION

- (1) Position the insulation panel on the underside of the hood.
- (2) Install the insulation panel fasteners.
- (3) Close the hood.

## LATCH

### REMOVAL

- (1) Remove nuts attaching latch to radiator cross-member support (Fig. 2).
- (2) Disconnect hood release cable from latch.
- (3) Separate latch from vehicle.

**Fig. 2 HOOD LATCH**

- 1 - HOOD RELEASE CABLE
- 2 - LATCH
- 3 - BUMPER

### INSTALLATION

- (1) Connect latch release cable to latch.
- (2) Position latch on radiator crossmember support.
- (3) Install nuts attaching latch to radiator cross-member support. Tighten nuts to 11 N·m (8 ft. lbs.) torque (Fig. 2).
- (4) Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

## LATCH RELEASE CABLE

### REMOVAL

- (1) Disconnect cable from hood latch (Fig. 3).
- (2) Disconnect cable from retaining clips on left inner fender panel.
- (3) Remove left cowl side trim panel.
- (4) Remove fasteners attaching cable bracket to cowl side panel (Fig. 4).
- (5) Route cable through dash panel and remove it from under instrument panel.

80b3c70a

**Fig. 3 HOOD LATCH**

- 2 - HOOD RELEASE CABLE

80b3c6fe

**Fig. 4 HOOD RELEASE CABLE**

- 1 - LOWER COWL
- 2 - HOOD RELEASE CABLE
- 3 - RELEASE HANDLE

### INSTALLATION

- (1) Route cable through hole in dash panel into engine compartment.
- (2) Pull cable forward and seat grommet in dash panel.
- (3) Position cable bracket on cowl side panel and install fasteners (Fig. 4).
- (4) Install left cowl side trim panel.
- (5) Route and install cable in retaining clips on left inner fender panel.
- (6) Connect cable to hood latch (Fig. 3).

## CLUSTER BEZEL

## REMOVAL

**WARNING:** ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE,

**THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

## CLUSTER BEZEL (Continued)

(2) Place the tilt steering wheel in its fully lowered position.

(3) Using a trim stick C-4755 or equivalent, gently pry each of the four corners of the cluster bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 1).

**Fig. 1 CLUSTER BEZEL REMOVE/INSTALL**

- 1 - INSTRUMENT CLUSTER
- 2 - INSTRUMENT PANEL CLUSTER BEZEL
- 3 - STEERING COLUMN OPENING COVER

(4) Being certain not to scratch the instrument cluster lens with the two snap clips on the lower edge of the cluster bezel, roll the top of the cluster bezel rearward over the top of the steering column.

(5) If equipped, reach behind the cluster bezel to access and disconnect the instrument panel wire harness connector for the headlamp leveling switch from the switch connector receptacle.

(6) Remove the cluster bezel from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the cluster bezel onto the instrument panel (Fig. 1).

(2) If equipped, reach behind the cluster bezel to access and reconnect the instrument panel wire harness connector for the headlamp leveling switch to the switch connector receptacle.

(3) Being certain not to scratch the instrument cluster lens with the two snap clips on the lower edge of the cluster bezel, slide the lower edge of the cluster bezel forward and down over the top of the steering column to position it onto the instrument panel.

(4) Align the two snap clips on the lower edge of the cluster bezel with their receptacles in the instrument panel.

(5) Press firmly on the cluster bezel over each of the lower snap clip locations until each of the snap clips is fully engaged in its receptacle.

(6) Align the two receptacles on the upper edge of the cluster bezel with the snap clips on the instrument panel.

(7) Press firmly on the cluster bezel over each of the upper snap clip locations until each of the snap clips is fully engaged in its receptacle.

(8) Connect the battery negative cable.

## GLOVE BOX

### STANDARD PROCEDURE - GLOVE BOX ROLL DOWN

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box until the integral stops on the back edge of the glove box bin are resting against the rubber stop bumpers in the upper glove box opening reinforcement.

(3) Reach into the glove box and with the middle finger of each hand, deflect the rubber flap of the two glove box stop bumpers on the upper glove box opening reinforcement toward the front of the vehicle.

## GLOVE BOX (Continued)

(4) With the glove box stop bumpers deflected, roll the glove box door downward until the integral stops on the back edge of the glove box bin pass through the rubber stop bumper openings in the upper glove box opening reinforcement (Fig. 2)

80b897d5

**Fig. 2 GLOVE BOX ROLL DOWN**

1 - GLOVE BOX DOOR

(5) Before rolling the glove box back up into the instrument panel, grasp the pneumatic glove box damper arm and pull the connector feature rearward to the end of its travel. The rubber stop bumpers will be deflected automatically by the integral stops on the back of the glove box when the glove box is rolled back up into the instrument panel.

(6) With the glove box stops oriented behind the stop bumpers, position the connector feature of the damper to the keyed slot on the outboard end of the glove box bin.

(7) Using hand pressure, press downward on the damper arm until the damper connector feature snaps back into the keyed slot.

**REMOVAL**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Roll the glove box down from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

**NOTE:** Be certain to use care not to damage or remove the glove box hinge bumpers on the lower instrument panel glove box opening reinforcement when removing the glove box from the instrument panel.

(3) Firmly grip both ends of the glove box door, then twist and pull the door as necessary to disengage the inboard hinge hook from the inboard hinge pin on the instrument panel and reorient the hook to the underside of the hinge pin (Fig. 3).

80b897d6

**Fig. 3 GLOVE BOX REMOVE/INSTALL**

1 - GLOVE BOX HINGE HOOKS AND HINGE PINS (3)

(4) Raise the glove box door until it is perpendicular to the instrument panel.

(5) Twist the door slightly in the counterclockwise direction and use a jiggling action to disengage the remaining two hinge hooks from their respective hinge pins on the instrument panel.

(6) Remove the glove box from the instrument panel.

## GLOVE BOX (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE:** Be certain to use care not to damage or remove the glove box hinge bumpers on the lower instrument panel glove box opening reinforcement when installing the glove box onto the instrument panel.

(1) Position the glove box to the instrument panel with the outboard hinge hook oriented over the outboard hinge pin and the center hinge hook oriented under the center hinge pin (Fig. 3).

(2) Raise the glove box door until it is perpendicular to the instrument panel.

(3) Firmly grip both ends of the glove box door and twist the door slightly in the clockwise direction to engage the inboard glove box hinge hook over the inboard hinge pin on the instrument panel.

(4) Roll the glove box back up into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(5) Connect the battery negative cable.

## GLOVE BOX LATCH

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE,**

**THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Roll down the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(3) Remove the three screws that secure the glove box latch to the inner glove box door (Fig. 4).

**Fig. 4 GLOVE BOX LATCH REMOVE/INSTALL**

- 1 - SCREW (3)
- 2 - LATCH HANDLE
- 3 - LATCH HANDLE POCKET
- 4 - BIN
- 5 - HINGE HOOKS
- 6 - DOOR
- 7 - GLOVE BOX LATCH
- 8 - STOPS

(4) Lift up on the latch handle on the outer glove box door far enough to loosen the latch assembly on the inner glove box door.

(5) Remove the latch unit from the inner glove box door.

## GLOVE BOX LATCH (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position the latch unit to the inner glove box door (Fig. 4).
- (2) Guide the latch handle into the latch handle pocket on the outer glove box door.
- (3) Install and tighten the three screws that secure the glove box latch to the inner glove box door.
- (4) Roll the glove box back up into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).
- (5) Connect the battery negative cable.

## GLOVE BOX LATCH STRIKER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) If the inboard glove box latch striker is being serviced, remove the lower right center bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL - REMOVAL). If the outboard glove box latch striker is being serviced,

remove the end cap from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

- (3) Remove the one screw that secures the upper mounting flange of the glove box latch striker to the instrument panel structural duct at either side of the glove box opening (Fig. 5).

**Fig. 5 GLOVE BOX LATCH STRIKER REMOVE/INSTALL**

- 1 - SCREW
- 2 - GLOVE BOX LATCH STRIKER
- 3 - INSTRUMENT PANEL TOP PAD

- (4) Pull the upper mounting flange of the glove box latch striker downward to disengage the hook formation on the lower end of the striker from the mounting hole in the instrument panel structural duct.

- (5) Remove the glove box latch striker from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## GLOVE BOX LATCH STRIKER (Continued)

(1) Position the glove box latch striker to the instrument panel.

(2) Engage the hook formation on the lower end of the glove box latch striker in the mounting hole in the instrument panel structural duct.

(3) Roll the upper mounting flange of the glove box latch striker upward until it is flush with the instrument panel structural duct on either side of the glove box opening.

(4) Install and tighten the screw that secures the upper mounting flange of the glove box latch striker to the instrument panel structural duct (Fig. 5).

(5) If the inboard glove box latch striker was serviced, reinstall the lower right center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL - INSTALLATION). If the outboard glove box latch striker was serviced, reinstall the end cap onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(6) Connect the battery negative cable.

## INSTRUMENT PANEL END CAP

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and open the glove box.

(3) Remove the one screw that secures the outboard end of the end cap to the instrument panel top pad (Fig. 6).

(4) Remove the three screws that secure the end cap to the instrument panel glove box opening.

(5) Pull the end cap straight back from the instrument panel to disengage the one snap clip that secures it to the receptacle in the instrument panel structural duct.

(6) Remove the end cap from the instrument panel.

80b6b329

**Fig. 6 INSTRUMENT PANEL END CAP REMOVE/INSTALL**

- 1 - INSTRUMENT PANEL TOP PAD
- 2 - END CAP
- 3 - SCREW (4)

- 5 - LOWER RIGHT CENTER BEZEL

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Be certain that the glove box catch bumper is installed in the mounting hole nearest the outboard end of the end cap extension over the instrument panel upper glove box opening reinforcement (Fig. 6).

(2) Position the end cap to the instrument panel. Be certain that the end of the end cap extension near the center of the upper glove box opening reinforcement is positioned underneath the end of the extension from the lower right center bezel.

(3) Align the snap clip on the end cap with the receptacle on the instrument panel structural duct.

(4) Press firmly on the instrument panel end cap over the snap clip location until the snap clip is fully engaged in its receptacle.

## INSTRUMENT PANEL END CAP (Continued)

(5) Install and tighten the three screws that secure the end cap to the instrument panel glove box opening.

(6) Install and tighten the one screw that secures the outboard end of the end cap to the instrument panel top pad.

(7) Close and latch the glove box.

(8) Connect the battery negative cable.

INSTRUMENT PANEL  
STRUCTURAL DUCT

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel on a suitable work surface. Be certain to take the proper precautions to protect the instrument panel from any possible cosmetic damage.

(4) Remove all of the individual components that remain secured to the instrument panel structural duct as described elsewhere in this service information.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISO-**

**LATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Install all of the individual components that were removed from the instrument panel structural duct as described elsewhere in this service information.

(2) Install the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(3) Connect the battery negative cable.

INSTRUMENT PANEL TOP  
COVER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick C-4755 or equivalent, gently pry the rear edge (farthest from the windshield) of the top cover up and away from the instrument panel far enough to disengage the four snap clip retainers from their receptacles in the instrument panel top pad (Fig. 7).

(3) Remove the top cover from the top of the instrument panel.

## INSTRUMENT PANEL TOP COVER (Continued)

80b6b323

**Fig. 7 INSTRUMENT PANEL TOP COVER REMOVE/INSTALL**

- 1 - ULTRA LIGHT SENSOR PLUG
- 2 - SEAL

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) If the vehicle is not equipped with the optional automatic headlamps light sensor/vehicle theft security system indicator, be certain that the hole plug is installed in the clearance hole located to the outboard side of the driver side defroster outlet in the instrument panel top cover (Fig. 7).

(2) Before installing the top cover onto the top of the instrument panel, be certain that the rubber top cover seal is properly positioned on the forward edge of the top cover panel.

(3) Position the top cover onto the top of the instrument panel.

(4) Align the four snap clips on the top cover with the snap clip receptacles in the instrument panel top pad.

(5) Press firmly downward on the top cover over each of the four snap clip locations until each of the snap clips is fully seated in their receptacles in the instrument panel top pad.

(6) Connect the battery negative cable.

## INSTRUMENT PANEL TOP PAD

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(3) Remove the top cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(4) Remove the four nuts that secure the instrument panel top pad to the studs on the dash panel near the windshield fence line (Fig. 8).

(5) Remove the speakers from the instrument panel top pad. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL - INSTRUMENT PANEL SPEAKER).

(6) Disengage the retainer that secures each of the two instrument panel wire harness speaker take outs to the mounting hole in the instrument panel top pad. Tuck the loose ends of these speaker take outs down the defroster ducts to keep them out of the way during the remainder of this procedure.

(7) If equipped, remove the two screws that secure the automatic headlamp light sensor/vehicle theft security system indicator unit to the instrument panel top pad just outboard of the driver side defroster outlet. Move the sensor/indicator unit towards the windshield to keep it out of the way during the remainder of this procedure.

(8) Remove the cluster bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

## INSTRUMENT PANEL TOP PAD (Continued)

(18) Remove the center lower bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - LOWER - REMOVAL).

(19) Remove the four screws that secure the radio to the instrument panel structural duct. Pull the radio out of the instrument panel only far enough to access the screws that secure the top pad to the instrument panel structural duct.

## INSTRUMENT PANEL TOP PAD (Continued)

(20) Remove the four screws that secure the heater-A/C control to the instrument panel structural duct. Pull the heater-A/C control out of the instrument panel only far enough to access the screws that secure the top pad to the instrument panel structural duct.

(21) Remove all of the screws that secure the perimeter of the top pad to the instrument panel structural duct.

(22) Remove the front bin from the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(23) Reach through the front bin opening of the floor console to access and remove the two screws that secure the center floor tunnel bracket to the instrument panel.

(24) Reach through the front bin opening of the floor console to access and loosen the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel.

(25) Slide the center floor tunnel bracket rearward in the vehicle far enough to disengage the locating hole in the lower flange of the top pad from the locating pin on the instrument panel structural duct (Fig. 10).

**Fig. 10 INSTRUMENT PANEL TOP PAD REMOVE/INSTALL**

- 1 - STRUCTURAL DUCT
- 2 - LOCATING PIN
- 3 - INSTRUMENT PANEL TOP PAD
- 4 - LOWER FLANGE
- 5 - CENTER FLOOR TUNNEL BRACKET

(26) Remove the instrument panel top pad from the instrument panel structural duct.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

If the top pad is being replaced with a new unit, be certain to transfer or install the panel outlets and the passenger side trim bezel to the new unit before it is installed on the instrument panel structural duct. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - REMOVAL) and (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM BEZEL - PASSENGER - REMOVAL).

(1) Position the instrument panel top pad over the instrument panel structural duct and the studs on the dash panel near the windshield fence line.

(2) Route the instrument panel wire harness take out for the glove box lamp and switch unit to the switch mounting hole in the upper glove box opening reinforcement.

(3) Reach through the front bin opening of the floor console to engage the locating hole in the lower flange of the top pad with the locating pin on the instrument panel structural duct (Fig. 10).

(4) Reach through the front bin opening of the floor console to slide the center floor tunnel bracket forward in the vehicle far enough to capture the lower flange of the top pad between the bracket and the structural duct.

(5) Reach through the front bin opening of the floor console to install the two screws that secure the center floor tunnel bracket to the instrument panel and tighten to 11 N·m (8 ft. lbs.).

(6) Reach through the front bin opening of the floor console to install the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel and tighten to 11 N·m (8 ft. lbs.).

(7) Install the front bin into the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

## INSTRUMENT PANEL TOP PAD (Continued)

(8) Install all of the screws that secure the perimeter of the top pad to the instrument panel structural duct.

(9) Install the four screws that secure the heater-A/C control to the instrument panel structural duct.

(10) Install the four screws that secure the radio to the instrument panel structural duct.

(11) Install the center lower bezel.(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - LOWER - INSTALLATION).

(12) Install the center upper bezel.(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - UPPER - INSTALLATION).

(13) Install the two large screws on the glove box opening upper reinforcement that secure the top pad to the instrument panel structural duct (Fig. 9) and tighten to 11 N·m (8 ft. lbs.).

(14) Install the two small screws on the glove box opening upper reinforcement that secure the panel outlets to the instrument panel structural duct.

(15) Install the glove box lamp and switch.(Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/GLOVE BOX LAMP/SWITCH - INSTALLATION).

(16) Install the lower right center bezel.(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL - INSTALLATION).

(17) Install the end cap.(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(18) Roll the glove box back up.(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(19) Install the steering column opening cover.(Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(20) Install the instrument cluster.(Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

(21) Install the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(22) If equipped, position the automatic headlamp light sensor/vehicle theft security system indicator unit to the instrument panel top pad just outboard of the driver side defroster outlet. Install and tighten the two screws that secure the sensor/indicator unit.

(23) Engage the retainer that secures each of the two instrument panel wire harness speaker take outs to the mounting hole in the instrument panel top pad.

(24) Install the speakers onto the instrument panel top pad. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION - INSTRUMENT PANEL SPEAKER).

(25) Install the four nuts that secure the instrument panel top pad to the studs on the dash panel near the windshield fence line (Fig. 8), and tighten the nuts to 11 N·m (8 ft. lbs.).

(26) Install the top cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

(27) Install the trim onto the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(28) Reconnect the battery negative cable.

## INSTRUMENT PANEL C-CHANNEL COVER BRACKET

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel top down on a suitable work surface. Be certain to take the proper precautions to protect the top of the instrument panel from any possible cosmetic damage.

(4) Disengage the radio antenna coaxial cable retainer from the mounting hole in the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel c-channel cover bracket.

## INSTRUMENT PANEL C-CHANNEL COVER BRACKET (Continued)

(5) Remove the screw that secures the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel c-channel cover bracket (Fig. 11).

**Fig. 11 INSTRUMENT PANEL c-channel COVER BRACKET REMOVE/INSTALL**

- 1 - C-CHANNEL COVER BRACKET
- 2 - SCREWS (8)
- 3 - PASSENGER SIDE COURTESY LAMP
- 4 - INSTRUMENT PANEL WIRE HARNESS
- 5 - STRUCTURAL DUCT

(6) Remove the screw that secures the passenger side courtesy lamp to the lower tab of instrument panel c-channel cover bracket.

(7) Remove the eight screws that secure the c-channel cover bracket to the instrument panel structural duct.

(8) Remove the c-channel cover bracket from the instrument panel structural duct.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the c-channel cover bracket to the instrument panel structural duct.

(2) Install the eight screws that secure the c-channel cover bracket to the instrument panel structural duct (Fig. 11).

(3) Position the passenger side courtesy lamp to the lower tab of instrument panel c-channel cover bracket.

(4) Install the screw that secures the passenger side courtesy lamp to the lower tab of instrument panel c-channel cover bracket.

(5) Position the instrument panel wire harness mounting tab to the passenger side outboard end of the instrument panel c-channel cover bracket.

(6) Install the screw that secures the instrument panel wire harness mounting tab to the passenger side outboard end of the instrument panel c-channel cover bracket.

(7) Engage the radio antenna coaxial cable retainer in the mounting hole in the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel c-channel cover bracket.

(8) Install the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(9) Connect the battery negative cable.

## INSTRUMENT PANEL CENTER BEZEL - LOWER

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick C-4755 or equivalent, gently pry each of the four corners of the center lower bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 12).

(3) Pull the center lower bezel away from the instrument panel far enough to access the instrument panel wire harness connectors.

## INSTRUMENT PANEL CENTER BEZEL - LOWER (Continued)

**Fig. 12 INSTRUMENT PANEL CENTER LOWER BEZEL REMOVE/INSTALL**

- 1 - HEATER AND AIR CONDITIONER CONTROLS  
2 - TRIM STICK  
3 - CENTER LOWER BEZEL

(4) Squeeze the mounting legs of the ash receiver lamp hood and remove it from the rectangular hole in the ash receiver flame shield.

(5) If equipped, disconnect the instrument panel wire harness connectors for the two heated seat switches from the switch connector receptacles.

(6) Disconnect the instrument panel wire harness connectors for the cigar lighter and accessory power outlet from the lighter and outlet connector receptacles.

(7) Remove the center lower bezel from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the center lower bezel to the instrument panel.

(2) Connect the instrument panel wire harness connectors for the cigar lighter and the accessory

power outlet to the lighter and outlet connector receptacles.

(3) If equipped, connect the instrument panel wire harness connectors for the two heated seat switches to the switch connector receptacles.

(4) Squeeze the mounting legs of the ash receiver lamp hood and install them into the rectangular hole in the ash receiver flame shield.

(5) Align the two lower snap clips on the center lower bezel with their receptacles in the instrument panel top pad.

(6) Using hand pressure, press firmly and evenly on the center lower bezel over each of the lower snap clip locations until each of the snap clips is fully engaged in its receptacle.

(7) Align the two upper snap clips on the center lower bezel with their receptacles in the instrument panel top pad.

(8) Using hand pressure, press firmly and evenly on the center lower bezel over each of the upper snap clip locations until each of the snap clips is fully engaged in its receptacle.

(9) Connect the battery negative cable.

## INSTRUMENT PANEL CENTER BEZEL - UPPER

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick C-4755 or equivalent, gently pry each of the four corners of the center upper bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 13).

(3) Remove the center upper bezel from the instrument panel.

## INSTRUMENT PANEL CENTER BEZEL - UPPER (Continued)

**Fig. 13 INSTRUMENT PANEL CENTER UPPER BEZEL REMOVE/INSTALL**

- 1 - CENTER UPPER BEZEL
- 2 - RADIO
- 3 - TRIM STICK

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position the center upper bezel onto the instrument panel.
- (2) Align the four snap clips on the center upper bezel with their receptacles in the instrument panel top pad.
- (3) Using hand pressure, press firmly and evenly on the center upper bezel over each of the snap clip locations until each of the snap clips is fully engaged in its receptacle.
- (4) Connect the battery negative cable.

## INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE**

**ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the front bin from the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
- (3) Reach through the front bin opening of the floor console to access and disengage the instrument panel wire harness retainer from the mounting hole on the driver side of the instrument panel center floor tunnel bracket.
- (4) Remove the two screws that secure the center floor tunnel bracket to the instrument panel (Fig. 14).

**Fig. 14 INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET REMOVE/INSTALL**

- 1 - SCREW (2)
- 2 - NUT (2)
- 3 - STUDS
- 4 - CENTER FLOOR TUNNEL BRACKET

- (5) Remove the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel.
- (6) Remove the center floor tunnel bracket from the instrument panel and the floor panel transmission tunnel.

## INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the center floor tunnel bracket over the floor panel transmission tunnel studs and slide it up against the instrument panel (Fig. 14).

(2) Install the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel and tighten to 11 N·m (8 ft. lbs.).

(3) Install the two screws that secure the center floor tunnel bracket to the instrument panel and tighten the screws to 11 N·m (8 ft. lbs.).

(4) Reach through the front bin opening of the floor console to access and engage the instrument panel wire harness retainer with the mounting hole on the driver side of the instrument panel center floor tunnel bracket.

(5) Install the front bin into the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(6) Connect the battery negative cable.

INSTRUMENT PANEL  
COURTESY LAMP BRACKET

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel fuse cover from the bottom of the junction block (JB) and body control module (BCM) unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

(3) Reach under the steering column opening cover to access and remove the screw that secures the courtesy lamp unit to the lower end of the instrument panel courtesy lamp bracket near the inboard side of the JB (Fig. 15).

**Fig. 15 INSTRUMENT PANEL COURTESY LAMP BRACKET REMOVE/INSTALL**

- 1 - STEERING COLUMN
- 2 - SCREW
- 3 - COURTESY LAMP BRACKET
- 4 - DRIVER SIDE COURTESY LAMP
- 5 - JUNCTION BLOCK
- 6 - SCREW

(4) Remove the courtesy lamp from the lower end of the courtesy lamp bracket.

(5) Reach under the steering column opening cover to access and remove the screw that secures the courtesy lamp bracket and the inboard side of the JB to the instrument panel steering column support bracket.

(6) Remove the courtesy lamp bracket from the inboard side of the JB and the instrument panel steering column support bracket.

## INSTRUMENT PANEL COURTESY LAMP BRACKET (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Reach under the instrument panel to position the upper end of the courtesy lamp bracket to the inboard side of the junction block (JB) and the instrument panel steering column support bracket (Fig. 15).

(2) Install the screw that secures the courtesy lamp bracket and the inboard side of the JB to the instrument panel steering column support bracket.

(3) Position the courtesy lamp to the lower end of the courtesy lamp bracket.

(4) Install the screw that secures the courtesy lamp to the lower end of the courtesy lamp bracket.

(5) Install the instrument panel fuse cover to the bottom of the JB and body control module (BCM) unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(6) Connect the battery negative cable.

INSTRUMENT PANEL  
INTERMEDIATE BRACKET

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the accelerator pedal assembly from the shoulder studs on the dash panel. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - REMOVAL).

(3) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(4) Remove the one nut that secures the instrument panel intermediate bracket to the stud on the dash panel (Fig. 16).

80b6f01b

- 6 - ACCELERATOR PEDAL
- 7 - SHOULDER STUDS

(5) Remove the instrument panel intermediate bracket from the two shoulder studs and the one stud on the dash panel.

## INSTRUMENT PANEL INTERMEDIATE BRACKET (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the instrument panel intermediate bracket to the two shoulder studs and the one stud on the dash panel (Fig. 16).

(2) Loosely install the one nut that secures the intermediate bracket to the one stud on the dash panel.

(3) Install the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(4) Install the accelerator pedal assembly onto the shoulder studs on the dash panel. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - INSTALLATION).

(5) Connect the battery negative cable.

## INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and open the glove box.

(3) Remove the three screws that secure the lower right center bezel to the instrument panel glove box opening (Fig. 17).

80b6b32c

**Fig. 17 INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL REMOVE/INSTALL**

- 1 - INSTRUMENT PANEL TOP PAD
- 2 - END CAP
- 3 - SCREWS (3)
- 4 - BUMPER
- 5 - LOWER RIGHT CENTER BEZEL

(4) Pull the lower right center bezel straight back from the instrument panel to disengage the two snap clips that secure it to the receptacles in the instrument panel top pad.

(5) Remove the lower right center bezel from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Be certain that the glove box catch bumper is installed in the mounting hole nearest the inboard end of the lower right center bezel extension over the

## INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL (Continued)

instrument panel upper glove box opening reinforcement.

(2) Position the lower right center bezel to the instrument panel. Be certain that the end of the lower right center bezel extension near the center of the upper glove box opening reinforcement is positioned on top of the end of the extension from the end cap (Fig. 17).

(3) Align the snap clips on the lower right center bezel with the receptacles in the instrument panel top pad.

(4) Using hand pressure, press firmly on the lower right center bezel over each of the snap clip locations until the snap clips are fully engaged in their receptacles.

(5) Install the three screws that secure the lower right center bezel to the instrument panel glove box opening.

(6) Close and latch the glove box.

(7) Connect the battery negative cable.

## INSTRUMENT PANEL STEERING COLUMN BRACKET

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(3) Remove the four screws that secure the steering column bracket to the instrument panel steering column support bracket (Fig. 18).

(4) Remove the steering column bracket from the instrument panel steering column support bracket.

80b6b32d

**Fig. 18 INSTRUMENT PANEL STEERING COLUMN BRACKET REMOVE/INSTALL**

1 - INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET

2 - SCREW (4)

3 - INSTRUMENT PANEL STEERING COLUMN BRACKET

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the steering column bracket to the instrument panel steering column support bracket (Fig. 18).

(2) Install the four screws that secure the steering column bracket to the instrument panel steering column support bracket and tighten the screws to 11 N·m (9 ft. lbs.).

(3) Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(4) Connect the battery negative cable.

## INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the instrument panel plenum bracket from the steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL PLENUM BRACKET - REMOVAL).

(4) Remove the three screws that secure the instrument panel wire harness mounting tabs to the back of the steering column support bracket.

(5) Remove the two screws that secure the 16-way data link connector to the instrument panel steering column support bracket and remove the connector from the bracket (Fig. 19).

(6) Remove the junction block (JB) and body control module (BCM) unit from the instrument panel steering column support bracket, but do not disconnect any of the instrument panel wire harness connectors from the unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).

(7) From the face of the instrument panel, remove the five screws that secure the steering column support bracket to the instrument panel structural duct.

(8) Remove the steering column support bracket from the instrument panel structural duct.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING**

**Fig. 19 INSTRUMENT PANEL STEERING COLUMN  
SUPPORT BRACKET REMOVE/INSTALL**

- 1 - STRUCTURAL DUCT

THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the steering column support bracket to the instrument panel structural duct.

(2) From the face of the instrument panel, install the five screws that secure the steering column support bracket to the instrument panel structural duct (Fig. 19), and tighten the screws to 11 N·m (8 ft. lbs.).

(3) Position the instrument panel wire harness mounting tabs to the back of the steering column support bracket.

(4) Install the three screws that secure the instrument panel wire harness mounting tabs to the back of the steering column support bracket.

(5) Install the instrument panel plenum bracket onto the steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL PLENUM BRACKET - INSTALLATION).

(6) Install the junction block (JB) and body control module (BCM) unit onto the instrument panel steering column support bracket. (Refer to 8 - ELECTRI-

## INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET (Continued)

CAL/POWER DISTRIBUTION/JUNCTION BLOCK - INSTALLATION).

(7) Position the 16-way data link connector to the instrument panel steering column support bracket.

(8) Install the two screws that secure the 16-way data link connector to the instrument panel steering column support bracket.

(9) Install the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

(10) Connect the battery negative cable.

## INSTRUMENT PANEL TRIM BEZEL - DRIVER

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick C-4755 or equivalent, gently pry the edges of the driver side trim bezel up and away from the instrument panel far enough to disengage the two snap clips from their receptacles (Fig. 20).

(3) Remove the driver side trim bezel from the instrument panel top pad.

**Fig. 20 INSTRUMENT PANEL DRIVER SIDE TRIM BEZEL REMOVE/INSTALL**

- 1 - INSTRUMENT PANEL TOP PAD
- 2 - DRIVER SIDE TRIM BEZEL
- 3 - TRIM STICK
- 4 - PANEL OUTLET

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the driver side trim bezel to the instrument panel top pad.

(2) Align the snap clips on the driver side trim bezel with the receptacles in the instrument panel top pad.

(3) Using hand pressure, press firmly and evenly on the driver side trim bezel over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Connect the battery negative cable.

## INSTRUMENT PANEL TRIM BEZEL - PASSENGER

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the top pad from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).
- (3) From the underside of the top pad, remove the four screws from the top of the passenger airbag door that secure the passenger side trim bezel to the instrument panel (Fig. 21).

**Fig. 21 INSTRUMENT PANEL PASSENGER SIDE TRIM BEZEL REMOVE/INSTALL**

- 1 - INSTRUMENT PANEL AIRBAG DOOR REINFORCEMENT
- 2 - PASSENGER AIRBAG DOOR
- 3 - PASSENGER SIDE TRIM BEZEL SCREWS (4)
- 4 - INSTRUMENT PANEL TOP PAD

- (4) Remove the passenger side trim bezel from the instrument panel top pad.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position the passenger side trim bezel to the instrument panel top pad.
- (2) From the underside of the top pad, install the four screws through the passenger airbag door that secure the passenger side trim bezel to the instrument panel (Fig. 21), and tighten the screws to 11 N·m (8 ft. lbs.).
- (3) Install the top pad onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION).
- (4) Connect the battery negative cable.

## STEERING COLUMN OPENING COVER

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the fuse cover from the junction block (JB) and body control module (BCM) unit under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

## STEERING COLUMN OPENING COVER (Continued)

(3) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(4) Remove the one screw that secures the outboard end of the steering column opening cover to the u-nut on the outboard end of the instrument panel top pad (Fig. 22).

**Fig. 22 STEERING COLUMN OPENING COVER REMOVE/INSTALL**

- 1 - INSTRUMENT PANEL TOP PAD  
2 - STEERING COLUMN OPENING COVER  
3 - SCREW (3)

(5) Remove the two screws that secure the lower edge of the steering column opening cover to the u-nuts on the instrument panel steering column support bracket.

(6) Pull the steering column opening cover rearward to disengage the three snap clips (one outboard and two inboard) that secure it to the receptacles in the instrument panel.

(7) Remove the steering column opening cover from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the steering column opening cover onto the instrument panel (Fig. 22).

(2) Align the three snap clips on the steering column opening cover with their receptacles in the instrument panel.

(3) Using hand pressure, press firmly and evenly on the steering column opening cover over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Install the two screws that secure the lower edge of the steering column opening cover to the instrument panel steering column support bracket.

(5) Install the one screw that secures the outboard end of the steering column opening cover to the u-nut on the outboard end of the instrument panel top pad.

(6) Install the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(7) Install the fuse cover onto the junction block (JB) and body control module (BCM) unit under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(8) Connect the battery negative cable.

## INSTRUMENT PANEL ASSEMBLY

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(3) Remove the top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

# INSTRUMENT PANEL ASSEMBLY (Continued)

(4) Remove the four nuts that secure the instrument panel to the studs on the dash panel near the windshield fence line (Fig. 23).

(5) Remove the scuff plates from the right and left front door sills. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).

(6) Remove the trim panels from the right and left inner cowl sides. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).

(7) Remove the console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(8) Remove the fuse cover from the junction block (JB). (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

(9) Remove the cluster bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(10) Remove the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(11) Remove the steering column bracket from the instrument panel steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL STEERING COLUMN BRACKET - REMOVAL).

(12) Remove the screw that secures the lower tilting steering column shroud to the steering column multi-function switch mounting housing (Fig. 24).

(13) Unsnap the two halves of the tilting steering column shroud from each other and remove both halves from the steering column.

80b04f0f

**Fig. 24 STEERING COLUMN SHROUDS REMOVE/INSTALL**

- 2 - NUT (4)

- 3 - INSTRUMENT PANEL
- 4 - DASH PANEL

## INSTRUMENT PANEL ASSEMBLY (Continued)

(14) Disconnect the instrument panel wire harness connectors from the following steering column components (Fig. 25):

- the two lower clockspring connector receptacles
- the left multi-function switch connector receptacle
- the right multi-function switch connector receptacle
- the two ignition switch connector receptacles
- the shifter interlock solenoid connector receptacle
- if equipped, the sentry key immobilizer module (SKIM) connector receptacle.

80b6b3a0

**Fig. 25 STEERING COLUMN CONNECTIONS**

- 4 - SHIFTER INTERLOCK CABLE CONNECTOR
- 5 - SHIFTER INTERLOCK SOLENOID CONNECTOR
- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

(15) Turn the ignition switch to the On position, then release and remove the shifter interlock cable connector from the ignition lock housing receptacle.

(16) Turn the ignition switch back to the Lock position to prevent steering wheel rotation and the loss of clockspring centering following steering column removal.

(17) Remove the bolt that secures the coupler to the lower steering column shaft (Fig. 26).

(18) Remove the four nuts that secure the steering column to the studs on the instrument panel steering column support bracket.

(19) Remove the steering column from the instrument panel. Be certain that the steering wheel is locked and secured from rotation to prevent the loss of clockspring centering.

80b6f08d

**Fig. 26 STEERING COLUMN MOUNTING**

- 1 - COLUMN MOUNTING NUTS
- 2 - COUPLER BOLT

(20) Disconnect the left and right body wire harness connectors, the ignition off draw (IOD) wire harness connector and the fused B(+) wire harness connector from the connector receptacles of the JB (Fig. 27).

80b6b3ad

**Fig. 27 JUNCTION BLOCK CONNECTIONS**

## INSTRUMENT PANEL ASSEMBLY (Continued)

(21) Disconnect the instrument panel wire harness connectors from the following floor panel transmission tunnel components (Fig. 28):

- the airbag control module (ACM) connector
- the park brake switch terminal
- the transmission shifter connector receptacle.

(22) Remove the two nuts that secure the instrument panel wire harness ground eyelets to the studs on the floor panel transmission tunnel in front of and behind the ACM.

(23) Disengage the retainers that secure the instrument panel wire harness to the floor panel transmission tunnel.

(24) Remove the instrument panel to center floor tunnel bracket from the instrument panel and the floor panel transmission tunnel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET - REMOVAL).

(25) Remove the one screw that secures the floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel and remove the duct from the housing.

(26) If the vehicle is equipped with the manual heating and air conditioning system, disconnect the vacuum harness connector located near the driver side of the floor panel transmission tunnel behind the driver side floor duct.

80b3c644

## INSTRUMENT PANEL ASSEMBLY (Continued)

(27) Remove the one screw that secures the instrument panel steering column support bracket to the driver side end of the heater and air conditioner housing (Fig. 29).

**Fig. 29 INSTRUMENT PANEL TO HEATER-A/C HOUSING - DRIVER SIDE**

- 1 - HEATER AND AIR CONDITIONER HOUSING
- 2 - FLOOR DUCT
- 3 - INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET
- 4 - SCREW

(28) Remove the one screw that secures the instrument panel steering column support bracket to the intermediate bracket on the driver side dash panel (Fig. 30).

**Fig. 30 INSTRUMENT PANEL TO INTERMEDIATE BRACKET MOUNTING**

- 1 - DASH PANEL
- 2 - SCREW
- 3 - INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET
- 4 - INTERMEDIATE BRACKET

(29) Remove the nut that secures the instrument panel steering column support bracket to the stud on the driver side cowl plenum panel (Fig. 31).

**Fig. 31 PANEL TO COWL PLENUM**

- 1 - SECONDARY SUPPORT BRACKET
- 2 - STEERING COLUMN SUPPORT BRACKET
- 3 - NUT

(30) Remove the nut and disconnect the safety strap from the support bracket. (Fig. 32)

**Fig. 32 DRIVERS SIDE SAFETY STRAP**

- 1 - NUT/STUD
- 2 - STRAP
- 3 - STEERING COLUMN SUPPORT BRACKET

## INSTRUMENT PANEL ASSEMBLY (Continued)

(31) Remove the two screws that secure the instrument panel to the driver side cowl side inner panel (Fig. 33).

**Fig. 33 INSTRUMENT PANEL TO DRIVER SIDE COWL SIDE INNER PANEL MOUNTING**

- 1 - INSTRUMENT PANEL
- 2 - SCREW (2)
- 3 - COWL SIDE PANEL

(32) Remove the end cap. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(33) Remove the lower right center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL - REMOVAL).

(34) Remove the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)

(35) Disconnect the instrument panel wire harness connector from the lower cavity of the inline connector on the passenger side cowl side inner panel (Fig. 34).

(36) Disconnect the two halves of the radio antenna coaxial cable connector near the right cowl side inner panel under the end of the instrument panel.

**Fig. 34 INSTRUMENT PANEL PASSENGER SIDE CONNECTION**

- 1 - INLINE CONNECTOR
- 2 - INSTRUMENT PANEL WIRE HARNESS CONNECTOR

(37) Disconnect the two instrument panel wire harness connectors from the two heater and air conditioner housing connectors located near the blower motor on the passenger side end of the housing (Fig. 35).

**Fig. 35 HEATER AND AIR CONDITIONER HOUSING CONNECTIONS**

- 1 - INSTRUMENT PANEL
- 2 - HVAC HOUSING
- 3 - INSTRUMENT PANEL WIRE HARNESS
- 4 - BLOWER MOTOR

## INSTRUMENT PANEL ASSEMBLY (Continued)

(38) Remove the two screws that secure the passenger side instrument panel structural duct to the heater and air conditioner housing (Fig. 36).

808c0e68

**Fig. 36 PASSENGER SIDE INSTRUMENT PANEL TO HEATER-A/C HOUSING MOUNTING**

- 1 - HEATER AND AIR CONDITIONER HOUSING
- 2 - RETAINER TAB
- 3 - INSTRUMENT PANEL STRUCTURAL DUCT
- 4 - SCREW (2)

(39) Remove the two screws that secure the instrument panel to the passenger side cowl side inner panel (Fig. 37).

(40) Depress the tab on the passenger side and with the aid of an assistant, lift the instrument panel assembly upward off of the studs on the dash panel near the windshield fence line and pull the instrument panel rearward from the dash panel and the cowl side inner panels and remove it through the driver side front door of the vehicle. (Fig. 38)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Prior to installing the instrument panel into the vehicle, loosen the three nuts that secure the instrument panel intermediate bracket and the accel-

erator pedal assembly to the studs on the dash panel (Fig. 30).

(2) With the aid of an assistant, load the instrument panel assembly through the driver side front

## INSTRUMENT PANEL ASSEMBLY (Continued)

door of the vehicle and hang it on the studs on the dash panel near the windshield fence line (Fig. 23).

(3) Be certain that the molded plastic guide/pin formations on the instrument panel structural duct are inserted into and seated in the guide holes at each cowl side inner panel.

(4) Loosely install the two screws that secure each end of the instrument panel to the cowl side inner panels.

(5) Install the two screws that secure the passenger side instrument panel structural duct to the heater and air conditioner housing (Fig. 36), and tighten to 11 N·m (8 ft. lbs.).

(6) Install the one screw that secures the instrument panel steering column support bracket to the driver side end of the heater and air conditioner housing (Fig. 29), and tighten the to 11 N·m (8 ft. lbs.).

(7) Tighten the two screws that secure each end of the instrument panel to the cowl side inner panels (Fig. 33) and (Fig. 37), to 11 N·m (8 ft. lbs.).

(8) Install the one screw that secures the instrument panel steering column support bracket to the intermediate bracket on the driver side dash panel (Fig. 30), and tighten to 11 N·m (8 ft. lbs.).

(9) Tighten the three nuts that secure the instrument panel intermediate bracket and the accelerator pedal assembly to the studs on the dash panel to 11 N·m (8 ft. lbs.).

(10) Install the safety strap and tighten the nut.

(11) Install the four nuts that secure the instrument panel to the studs on the dash panel near the windshield fence line and tighten to 11 N·m (8 ft. lbs.).

(12) Install the nut that secures the instrument panel steering column support bracket to the stud on the driver side cowl plenum panel (Fig. 31), and tighten to 28 N·m (21 ft. lbs.).

(13) Install the instrument panel to center floor tunnel bracket onto the instrument panel and the floor panel transmission tunnel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET - INSTALLATION).

(14) Connect the two instrument panel wire harness connectors to the two heater and air conditioner housing connectors located near the blower motor on the passenger side end of the housing (Fig. 35).

(15) Connect the two halves of the radio antenna coaxial cable connector near the passenger cowl side inner panel under the end of the instrument panel.

(16) Connect the instrument panel wire harness connector to the lower cavity of the inline connector on the passenger side cowl side inner panel and tighten the connector screw (Fig. 34).

(17) Install the lower right center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL - INSTALLATION).

(18) Install the end cap onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(19) Install the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(20) If equipped with the manual heating and air conditioning system, connect the vacuum harness connector located near the driver side of the floor panel transmission tunnel behind the driver side floor duct.

(21) Position the driver side floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel (Fig. 29).

(22) Install the one screw that secures the driver side floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel.

(23) Route the instrument panel wire harness to the floor panel transmission tunnel and engage the retainers that secure the harness to the mounting brackets on the tunnel (Fig. 28).

(24) Install the instrument panel wire harness ground eyelets to the studs on the floor panel transmission tunnel in front of and behind the airbag control module and secure the eyelets with nuts and tighten to 7 N·m (60 in. lbs.).

(25) Connect the instrument panel wire harness connectors to the following floor panel transmission tunnel components:

- the airbag control module (ACM) connector receptacle
- the park brake switch terminal
- the transmission shifter connector receptacle.

(26) Connect the left and right body wire harness connectors, the ignition off draw (IOD) wire harness connector and the fused B(+) wire harness connector to the connector receptacles of the junction block (JB) and tighten the connector screws (Fig. 27).

(27) Engage the lower steering column shaft with the steering shaft coupler and position the steering column to the mounting studs on the instrument panel steering column support bracket (Fig. 26).

(28) Install the four nuts that secure the steering column to the studs on the instrument panel steering column support bracket and tighten to 11 N·m (8 ft. lbs.).

(29) Install the bolt that secures the coupler to the lower steering column shaft and tighten to 49 N·m (36 ft. lbs.).

## INSTRUMENT PANEL ASSEMBLY (Continued)

(30) Turn the ignition switch to the On position, then install the shifter interlock cable connector into the ignition lock housing receptacle.

(31) Connect the instrument panel wire harness connectors to the following steering column components (Fig. 25):

- the two lower clockspring connector receptacles
- the left multi-function switch connector receptacle
- the right multi-function switch connector receptacle
- the two ignition switch connector receptacles
- the shifter interlock solenoid connector receptacle
- if the vehicle is so equipped, the sentry key immobilizer module (SKIM) connector receptacle.

(32) Position the lower tilting steering column shroud to the steering column multi-function switch mounting housing, then install and tighten the screw that secures the shroud to the housing (Fig. 24).

(33) Position the upper tilting steering column shroud over the steering column. Align the upper and lower shrouds with each other and snap the two halves together.

(34) Install the steering column bracket onto the instrument panel steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/IN-

STRUMENT PANEL STEERING COLUMN BRACKET - INSTALLATION).

(35) Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(36) Install the cluster bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(37) Install the fuse cover onto the JB. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(38) Install the console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(39) Install the trim panels onto the right and left inner cowl sides. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

(40) Install the scuff plates onto the right and left front door sills. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).

(41) Install the top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

(42) Install the trim onto the right and left a-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(43) Connect the battery negative cable.

## A-PILLAR TRIM/GRAB HANDLE

## REMOVAL

- (1) Open the trim plugs and remove the bolts. (Fig. 1)
- (2) Remove the a-pillar trim/grab handle from the a-pillar.

## INSTALLATION

- (1) Align pin to attach hole of a-pillar.
- (2) Seat trim onto clips fully.
- (3) Install bolts. (Fig. 1)
- (4) Close trim plugs.

## ASSIST HANDLE

## REMOVAL

- (1) Remove the screws holding the assist handle to the roof panel.
- (2) Remove the assist handle from the roof panel.

## INSTALLATION

- (1) Align the assist handle with the screw holes in the roof panel.
- (2) Install the screws holding the assist handle to the roof panel.

810f7c2a

## B-PILLAR LOWER TRIM

### REMOVAL

- (1) Remove front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Remove the front seat belt as necessary. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
- (3) Un-clip forward leg of quarter panel trim from b-pillar lower rear edge. Un-clip remaining clips along quarter panel trim leg for easier access to screws.
- (4) Remove screws attaching front and rear of b-pillar lower trim to floor. (Fig. 1)
- (5) Remove access cover and remove screw attaching b-pillar lower trim to b-pillar.
- (6) Grasp b-pillar lower trim and pull outward to separate from b-pillar.
- (7) Route seat/shoulder belt through access hole in b-pillar lower trim.
- (8) Separate b-pillar lower trim from b-pillar.

### INSTALLATION

- (1) Position b-pillar lower trim panel at b-pillar. (Fig. 1)
- (2) Route seat/shoulder belt through access hole in b-pillar lower trim.
- (3) Press b-pillar lower trim onto b-pillar.
- (4) Install upper screw attaching b-pillar lower trim to b-pillar.
- (5) Install access cover.
- (6) Install screw attaching front and rear of b-pillar lower trim to floor.
- (7) Re-clip quarter trim panel leg to floor.
- (8) Install front seat shoulder belt. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
- (9) Install front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

## B-PILLAR UPPER TRIM

### REMOVAL

- (1) Using a trim stick or another suitable wide flat-bladed tool, gently pry the top of the turning loop trim cover to unsnap it from the height adjuster and access the screw that secures the front seat belt turning loop to the adjuster on the upper b-pillar. (Fig. 2)
- (2) Remove the screw that secures the seat belt turning loop to the height adjuster on the upper b-pillar. (Fig. 3)
- (3) Remove the seat belt turning loop from the height adjuster.
- (4) Remove the screw attaching lower b-pillar trim. (Fig. 1)

- (5) Pull lower b-pillar trim out far enough to remove upper trim panel.

- (6) Grasp upper b-pillar trim at lower edge and pull outward then down to detach from b-pillar.

### INSTALLATION

- (1) Position b-pillar trim panel on b-pillar. (Fig. 1)
- (2) Install screw attaching lower b-pillar trim panel.

## B-PILLAR UPPER TRIM (Continued)

(3) Position the seat belt turning loop onto the height adjuster on the upper B-pillar.

(4) Install screw that secures the seat belt turning loop to the height adjuster and tighten to 37 N·m (27 ft. lbs.).

(5) Using hand pressure, press the top of the turning loop trim cover to snap it onto the height adjuster and cover the screw that secures the front seat belt turning loop to the adjuster on the upper B-pillar. (Fig. 3)

## CARPETS AND FLOOR MATS

## REMOVAL

## REMOVAL - FRONT CARPET

(1) Remove door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(2) Remove the B-pillar lower trim, refer to (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).

(3) Remove front seats (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(4) Remove the rear seats lower cushions (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).

(5) Remove center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(6) Disconnect air ducts from instrument panel to carpet at tunnel near instrument panel (both sides).

(7) Remove any other interfering trim or molding.

(8) Lift carpet and mat from floor panel.

## REMOVAL - CARGO AREA CARPET

(1) Lift tailgate.

(2) Fold rear seat cushions forward.

(3) Remove rear seat backs (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).

(4) Remove rear shoulder belts (Refer to 8 - ELECTRICAL/RESTRAINTS/REAR SEAT BELT & RETRACTOR - REMOVAL).

(5) Remove retractable security cargo cover assembly.

(6) Remove spare tire cover.

(7) Remove rear cargo tie down footman loops. The side mounted footman loops are retained by screws. The floor footman loops are riveted (Fig. 4).

(8) Remove quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)

(9) Remove CD changer, if equipped (Refer to 8 - ELECTRICAL/AUDIO/CD CHANGER - REMOVAL).

(10) Remove jack tools and jack.

(11) Remove Infinity amp, if equipped (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).

(12) Remove carpet.

**Fig. 4 CARGO AREA CARPET**

- 1 - CARGO AREA CARPET
- 2 - RIVET
- 3 - CARGO TIE-DOWN LOOP

## INSTALLATION

## INSTALLATION - FRONT CARPET

(1) Carefully lay the carpet and mat on the floor panel. Align the carpet to allow installation of the components fastened to the floor panel.

(2) Connect instrument panel air ducts to carpet at each side of tunnel near instrument panel.

(3) Install the center console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(4) Install the front seats (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(5) Install the rear seat cushions (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

(6) Install the lower B pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).

(7) Install the door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(8) Install any other moldings or trim panels removed.

## INSTALLATION - CARGO AREA CARPET

(1) Thoroughly clean the area with Mopar Super Kleen®, or equivalent.

(2) Install carpet

(3) Install quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)

(4) Install CD changer, if equipped (Refer to 8 - ELECTRICAL/AUDIO/CD CHANGER - INSTALLATION).

(5) Install footman loops (Fig. 4).

(6) Install rear shoulder belts (Refer to 8 - ELECTRICAL/RESTRAINTS/REAR SEAT BELT & RETRACTOR - INSTALLATION).

## CARPETS AND FLOOR MATS (Continued)

(7) Install rear seat backs (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

(8) Install Infinity amp, if equipped (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).

(9) Install jack tools and jack.

(10) Install spare tire cover.

(11) Install retractable security cover.

## COWL TRIM

## REMOVAL

(1) Remove front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(2) Remove screws attaching cowl trim to floor.

(3) Remove plastic nut.

(4) Grasp cowl trim and pull outward to separate from clip.

(5) Separate cowl trim from vehicle.

## INSTALLATION

(1) Position cowl trim and press into place.

(2) Install screws attaching cowl trim to floor.

(3) Install plastic nut.

(4) Install front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

## C-PILLAR TRIM

## REMOVAL

(1) Fold the rear seat cushion forward against the back of the front bucket seat.

(2) Remove the screw that secures the rear outboard seat belt lower anchor to the rear floor panel. (Fig. 5)

(3) Un-clip forward leg of quarter panel trim and position aside as necessary. (Fig. 6)

(4) Grasp upper c-pillar trim at lower edge and pull outward then down to detach from c-pillar.

(5) Route rear shoulder belt through access hole.

(6) Separate c-pillar upper trim from vehicle.

**Fig. 5 REAR OUTBOARD SEAT BELT & RETRACTOR REMOVE/INSTALL**

- 1 - C-PILLAR
- 2 - TURNING LOOP
- 3 - SCREW
- 4 - UPPER C-PILLAR TRIM
- 5 - RETRACTOR
- 6 - SCREW
- 7 - QUARTER TRIM PANEL
- 8 - REAR FLOOR PANEL
- 9 - LOWER ANCHOR
- 10 - SCREW

## INSTALLATION

(1) Position c-pillar upper trim at c-pillar. (Fig. 6)

(2) Route rear shoulder belt through access hole.

(3) Press upper edge of c-pillar upper trim onto c-pillar and slide up into place onto the upper hook fasteners.

(4) Seat the lower edge clip fully.

(5) Press quarter panel trim into place as necessary.

(6) Ensure front edge of trim is covered by weatherstrip.

(7) Position the rear outboard seat belt lower anchor to the rear floor panel. (Fig. 5)

(8) Install screw that secures the rear outboard seat belt lower anchor to the rear floor panel and tighten to 43 N·m (32 ft. lbs.).

## C-PILLAR TRIM (Continued)

810f7f4a

## DOOR SILL SCUFF PLATE

## REMOVAL

- (1) Using a trim stick C-4755 or equivalent, carefully pry up the scuff plate from the door sill. (Fig. 7)
- (2) Remove the scuff plate.

## INSTALLATION

- (1) Install the scuff plate on the door sill (Fig. 7).
- (2) Press the molded in snap retainers into the door sill.

## DOOR SILL TRIM

## REMOVAL

The sill trim molding is held in place with molded in snap retainers (Fig. 7).

- (1) Using a trim stick C-4755 or equivalent, carefully pry up one corner of the sill trim.
- (2) Grasp the edge of the trim and pull up gently to release the snap retainers.

## INSTALLATION

- (1) Position the sill molding on the door sill.
- (2) Press the snap retainers into place.

810f7c2a

- 11 - DOOR SILL SCUFF PLATE
- 12 - DOOR SILL TRIM

## D-PILLAR TRIM

### REMOVAL

The d-pillar trim is attached to the d-pillar with spring clips (Fig. 8).

- (1) Remove liftgate opening upper trim panel (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
- (2) Grasp d-pillar trim and pull outward from d-pillar.
- (3) Separate d-pillar trim from d-pillar.

**Fig. 8 D-PILLAR UPPER TRIM**

1 - D-PILLAR UPPER TRIM

### INSTALLATION

- (1) Position d-pillar trim panel at d-pillar and press into place.
- (2) Install upper liftgate opening trim panel (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

## FLOOR CONSOLE

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY OPERATION REQUIRING THE KEY TO BE TURNED "ON", WHILE WORKING IN THE CONSOLE AREA. E.G. CONSOLE, CARPET, OR SEAT REMOVAL OR INSTALLATION; SHIFTER LINKAGE ADJUSTMENT OR REPLACEMENT; PARKING BRAKE CABLE REPLACEMENT OR ADJUSTMENT. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES**

**FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Set park brake.
- (2) Place transmission shift lever and transfer case lever in full rearward position.
- (3) Remove mat from front bin and remove screws attaching front of console to floor (Fig. 9).
- (4) Remove screws attaching rear bin to console.
- (5) Remove rear bin.
- (6) Pull rear passenger cupholder outward to access screws.
- (7) Remove screws attaching rear of console to floor.
- (8) Lift the console upward and rearward.
- (9) Remove console from vehicle.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY OPERATION REQUIRING THE KEY TO BE TURNED "ON", WHILE WORKING IN THE CONSOLE AREA. E.G. CONSOLE, CARPET, OR SEAT REMOVAL OR INSTALLATION; SHIFTER LINKAGE ADJUSTMENT OR REPLACEMENT; PARKING BRAKE CABLE REPLACEMENT OR ADJUSTMENT. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position console in vehicle. Ensure rear passenger HEVAC duct is engaged.
- (2) Install screws attaching rear of console to floor.
- (3) Position rear bin in console.
- (4) Install screws attaching rear bin to console.
- (5) Install screws attaching front of console to floor and place front bin mat in front bin.
- (6) Return transmission shift lever and transfer case lever to original position.
- (7) Release park brake.

## FLOOR CONSOLE (Continued)

- 7 - MAT

## HEADLINER

### REMOVAL

**CAUTION:** The headliner is a one-piece, molded component. It has limited flexibility and must not be bent. Damage may possibly result.

- (1) Record radio presets and disconnect negative battery cable.
- (2) Remove a-pillar trim moldings (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
- (3) Remove b-pillar upper trim moldings (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
- (4) Remove c-pillar trim moldings (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
- (5) Remove d-pillar trim molding (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
- (6) Remove the sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
- (7) Disconnect the vanity lamp electrical connector.
- (8) Remove assist handles from roof rails (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).
- (9) Remove dome lamp and overhead console, if equipped.
- (10) Remove rear cargo/dome lamp.
- (11) Roll sunroof welt under headliner edge so headliner can be removed.
- (12) Disengage rear washer hose from liftgate (Fig. 10).
- (13) Disengage the wire harness connectors at rear of headliner.
- (14) Disconnect the rear washer hose at the left a-pillar (Fig. 11).
- (15) Disengage the wire harness for the sunroof, if equipped.
- (16) Fold down the rear seats, move the front seats full forward, and lower the front seat backs.
- (17) Partially lower the headliner and disengage the sunroof drain hoses, if equipped (Fig. 12).
- (18) With the aid of an assistant, remove the headliner through the liftgate opening.

### INSTALLATION

- (1) With the aid of an assistant, position the headliner in the vehicle.
- (2) Connect the sunroof drain hoses, if equipped.
- (3) Connect the sunroof harness, the rear wire harnesses, and the washer hose at the a-pillar and at the liftgate.
- (4) Roll sunroof weld edge back over headliner edge.

80b9a4cf

**Fig. 12 HEADLINER**

- 1 - SUNROOF PINCH WELT  
2 - ROOF  
3 - REAR WASHER HOSE

- 4 - HEADLINER  
5 - SUNROOF

(5) Install the roof rail assist handles (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).

(6) Install the sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

(7) Install the overhead console, if equipped.

(8) Install the rear cargo/dome lamp.

(9) Install the d-pillar trim (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

(10) Install the c-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

(11) Install the upper b-pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

(12) Install the a-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(13) Connect the negative battery cable.

(1) Grasp the rear of the trim piece and pull down and back to disengage clips (Fig. 13).

(2) Slide the trim piece to the rear to disengage headliner locating hooks.

80bdbce8

**Fig. 13 UPPER LIFTGATE OPENING TRIM**

- 1 - UPPER LIFTGATE OPENING TRIM

## LIFTGATE OPENING UPPER TRIM

### REMOVAL

The upper liftgate opening trim is held on with spring clips.

## LIFTGATE OPENING UPPER TRIM (Continued)

**Fig. 14 HEADLINER LOCATING HOOKS**

- 1 - UPPER LIFTGATE OPENING TRIM  
2 - HEADLINER

**INSTALLATION**

The liftgate upper opening trim piece is equipped with headliner locating hooks (Fig. 14).

(1) Align the locating hooks with the slots in the headliner.

(2) Engage the spring clips and press the liftgate upper opening trim panel into place.

**LIFTGATE SCUFF PLATE****REMOVAL**

(1) Remove screws at outboard end of lower liftgate trim panel.

(2) Open the spare tire cover and remove the screws near the center of the lower liftgate trim panel (Fig. 15).

(3) Remove the lower liftgate trim panel.

**INSTALLATION**

(1) Align the screw holes and locators to the holes in the liftgate opening.

(2) Install the screws in the liftgate opening trim panel.

(3) Install the spare tire cover.

**Fig. 15 LIFTGATE OPENING TRIM PANEL**

- 1 - UPPER LIFTGATE OPENING TRIM PANEL  
2 - LOWER LIFTGATE OPENING TRIM PANEL

**QUARTER TRIM PANEL****REMOVAL**

(1) Move rear seat to cargo position.

(2) If equipped, remove sunshade cover.

(3) Open liftgate.

(4) Remove upper and lower liftgate opening trim panels (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).

(5) Remove d-pillar upper trim (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).

(6) Remove storage bin (right side only) (Refer to 23 - BODY/INTERIOR/REAR STORAGE BOX - REMOVAL).

(7) Remove mounting screws. (Fig. 16)

(8) Pull quarter trim panel forward and disengage connectors for CD player and power outlet, if equipped.

(9) Pull quarter trim panel extension in the rear door opening upward.

(10) Remove rear quarter trim panel.

## QUARTER TRIM PANEL (Continued)

810f7f4a

**Fig. 16 RIGHT SIDE TRIM PANEL**

- 1 - UPPER D-PILLAR TRIM
- 2 - SNAP-IN NUT
- 3 - SNAP IN NUT
- 4 - BRACKET

- 5 - QUARTER TRIM PANEL ASSEMBLY
- 6 - BRACKET
- 7 - UPPER C-PILLAR TRIM
- 8 - SEAT BELT RETRACTOR

**INSTALLATION**

(1) Position quarter trim panel, engage connectors for CD player and power outlet, if equipped, and align screw holes.

(2) Install quarter trim panel.

(3) Install storage bin (Refer to 23 - BODY/INTERIOR/REAR STORAGE BOX - INSTALLATION).

(4) Install d-pillar upper trim panel (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

(5) Install upper and lower liftgate opening trim panels (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

(6) If equipped, install sunshade cover.

(7) Install cargo loops.

(8) Move the rear seat to the upright position.

**REAR STORAGE BOX****REMOVAL**

(1) Open the storage bin lid and remove screws on each side of the lid hinge.

(2) Pull upward sharply on the bottom of the bin to disengage hooks.

(3) Raise bin and move inboard to disengage the quarter trim panel.

**INSTALLATION**

(1) Position the bin hooks high in the slots on the quarter trim panel.

(2) Push downward until the bin snaps into place.

(3) Install the hinge screws.

## REAR VIEW MIRROR

### REMOVAL

- (1) If equipped, disconnect mirror harness connector.
- (2) Loosen the mirror base setscrew (Fig. 17).
- (3) Slide the mirror base upward and off the bracket.

80b3c6eb

**Fig. 17 REAR VIEW MIRROR**

- 1 - CONNECTOR
- 2 - SCREW
- 3 - REAR VIEW MIRROR
- 4 - SUPPORT BUTTON
- 5 - WINDSHIELD

### INSTALLATION

#### INSTALLATION

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket (Fig. 17).
- (2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.
- (3) If equipped, connect mirror harness connector.

#### INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
- (3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
- (4) Apply accelerator to the surface on the bracket according to the following instructions:
  - (a) Crush the vial to saturate the felt applicator.
  - (b) Remove the paper sleeve.
  - (c) Apply accelerator to the contact surface on the bracket.
  - (d) Allow the accelerator to dry for five minutes.

- (e) Do not touch the bracket contact surface after the accelerator has been applied.

- (5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.

- (6) Install the bracket according to the following instructions:

- (a) Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
- (b) Apply an even coat of adhesive to the contact surface on the bracket.
- (c) Align the bracket with the marked position on the windshield glass.
- (d) Press and hold the bracket in place for at least one minute.

**NOTE:** Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

- (7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

- (8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

## SUN VISOR

### REMOVAL

- (1) Remove screws attaching sunvisor arm support bracket to headliner and roof panel.
- (2) Disengage electrical connections for vanity mirror, if equipped.
- (3) Detach sunvisor from support bracket.
- (4) Remove sunvisor from vehicle.
- (5) Remove retaining screw and support bracket.

### INSTALLATION

- (1) Install the retaining screw and support bracket.
- (2) Position the sunvisor in the vehicle.
- (3) Connect the electrical harness for the lighted vanity mirror, if equipped.
- (4) Attach the sunvisor to the support bracket.
- (5) Install the support bracket w/sunvisor onto the headliner and roof panel.

## COVER - FUEL FILLER

### REMOVAL

**NOTE:** In the event of a collision, the fuel filler cover is serviceable using the following procedure.

- (1) Remove the push pin fasteners. (Fig. 18)
- (2) Using a chisel or other suitable tool, remove the damaged cover.
- (3) Remove any remaining adhesive and clean mating surfaces.

**Fig. 18 FUEL FILLER COVER**

- 1 - FUEL FILLER COVER  
2 - PUSH PIN FASTENERS (4)

### INSTALLATION

**NOTE:** In the event of a collision, the fuel filler cover is serviceable using the following procedure.

- (1) Add a roap bead of butyl sealer to the sealing surface of the new cover.
- (2) Position the new cover and install the push pin fasteners.

**CAUTION:** Do not drill holes or install fasteners along the centerline of the cover. Do not use screws or other sharp fasteners during installation of the replacement cover.

- (3) Drill six 1/8 in holes in the locations indicated. (Fig. 19)
- (4) Install six 1/8 inch rivets that have a 1/2 inch reach into the six holes.

**Fig. 19 FUEL FILLER COVER HOLE LOCATIONS**

- 1 - FUEL FILLER COVER  
2 - HOLE DRILL LOCATIONS (6)

## PAINT CODE

### DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Safety Certification Label (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE SAFETY CERTIFICATION LABEL - DESCRIPTION) or the Body Code Plate (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. (Refer to 23 - BODY/PAINT - SPECIFICATIONS)

## BASECOAT/CLEARCOAT FINISH

### DESCRIPTION

The original equipment finish is a multi step process that involves cleaning, applying electro deposition (E-coat), anti-chip primer, basecoat, and clearcoat steps.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

**CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**

**Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.**

## PAINT TOUCH-UP

### DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION) for Body Code Plate information.

**WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**

### STANDARD PROCEDURE - PAINT TOUCH-UP

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good sur-

face finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

**WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT. AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**

## FINESSE SANDING/BUFFING & POLISHING

### DESCRIPTION

**CAUTION: Do not remove more than .5 mils of clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.**

**Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine film thickness before and after the repair.**

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

## FRONT HEADREST

### REMOVAL

- (1) Lift head restraint to full up position.
- (2) Using a small flat blade, depress tab on right side head restraint release button and using your hand, simultaneously press tab on left side head restraint release button (Fig. 1), and pull head restraint up to separate from seat back.

**Fig. 1 HEAD RESTRAINT**

- 1 - HEAD RESTRAINT  
2 - FLAT BLADE

### INSTALLATION

- (1) Position head restraint in seat back, press tab on left side head restraint release button and push down head restraint to secure.

## FRONT HEADREST SLEEVE

### REMOVAL

- (1) Remove head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - REMOVAL).
- (2) Remove seat back cover (Refer to 23 - BODY/SEATS/FRONT SEAT BACK COVER - REMOVAL).
- (3) Remove hog rings attaching cushion pad to seat back frame (Fig. 2).
- (4) Remove cushion pad from seat back frame.
- (5) Rotate head restraint sleeve 1/4 turn counter-clockwise to release retaining tab.
- (6) Pull sleeve from seat back frame (Fig. 3).

### INSTALLATION

- (1) Position sleeve in seat back frame.
- (2) Rotate head restraint sleeve 1/4 turn clockwise to engage retaining tab.
- (3) Install cushion pad onto seat back frame.
- (4) Install hog rings attaching cushion pad to seat back frame.

80b6f0a4

**Fig. 2 CUSHION PAD**

- 1 - HOG RING  
2 - SEAT BACK CUSHION PAD

80b6f0a5

**Fig. 3 HEAD RESTRAINT SLEEVE**

- 1 - HEAD RESTRAINT SLEEVE  
2 - SEAT BACK FRAME  
3 - RETAINING TAB

- (5) Install seat back cover (Refer to 23 - BODY/SEATS/FRONT SEAT BACK COVER - INSTALLATION).

- (6) Install head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - INSTALLATION).

## FRONT SEAT

### REMOVAL

- (1) Move seat to full rearward position.
- (2) Remove front bolts attaching seat to floor pan (Fig. 4).
- (3) Move seat to full forward position.
- (4) Using a trim stick C-4755 or equivalent, pry cover from seat track (power seat only).
- (5) Remove rear bolts attaching seat to floor pan.
- (6) If equipped, disconnect power seat wire harness connector.
- (7) Remove seat from vehicle.

**Fig. 4 FRONT BUCKET SEAT**

- 1 - POWER BUCKET SEAT  
2 - FLOOR PAN  
3 - SEAT TRACK COVER

### INSTALLATION

- (1) Position seat on floor pan.
- (2) If equipped, connect power seat wire harness connector.
- (3) Install rear bolts attaching seat to floor pan and tighten to 40 N·m (30 ft. lbs.).
- (4) If equipped, install cover on seat track.
- (5) Move seat to full rearward position.
- (6) Install front bolts attaching seat to floor pan and tighten to 40 N·m (30 ft. lbs.).

## FRONT SEAT BACK

### REMOVAL

- (1) Move seat to full rearward position.
- (2) Remove inboard bolt attaching seat back frame to seat cushion frame.
- (3) Move seat to full forward position.
- (4) Move seat back to full recline position.
- (5) Remove screws attaching seat side shield to seat frame.
- (6) Disconnect wire harness connector from recliner motor, if equipped.
- (7) From the underside of the seat, disconnect the wire harness connector for the power lumbar and/or heated seat, if equipped.
- (8) Remove outboard bolts attaching recliner to seat cushion frame.
- (9) Route the power lumbar and/or heated seat harness through the seat cushion cover, if equipped.
- (10) Separate seat back from seat cushion.

### INSTALLATION

- (1) Position seat back on seat cushion.
- (2) Route the power lumbar and heater harness through the seat cushion cover, if equipped.
- (3) Install recliner bolts attaching seat back frame to seat cushion frame and tighten to 28 N·m (20 ft. lbs.).
- (4) Install the inboard bolt attaching seat back frame to seat cushion frame and tighten to 47 N·m (35 ft.lbs.).
- (5) Connect wire harness connector to recliner motor and/or heated seat, if equipped.
- (6) From the underside of the seat, connect the power lumbar and/or heated seat wire harness connector to the seat harness, if equipped.
- (7) Install screws attaching seat side shield to seat frame.

## FRONT SEAT BACK COVER

### REMOVAL

- (1) Remove head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - REMOVAL).
- (2) Using a trim stick C-4755 or equivalent, carefully pry head restraint release button caps from the top of seat back.
- (3) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (4) Disengage J-strap at base of seat back.
- (5) Slide hand between the face of the seat back pad and the cushion cover and carefully separate hook and loop fastener (Fig. 5).
- (6) Roll cover upward and disengage hog rings.
- (7) Roll cover upward to top of seat back.
- (8) Separate cover from seat back.

**Fig. 5 SEAT BACK COVER**

- 1 - SEAT BACK COVER  
2 - HOOK AND LOOP FASTENER  
3 - SEAT BACK PAD

### INSTALLATION

- (1) Position cover inside-out at the top of seat back.
- (2) Roll cover downward.
- (3) Engage hog rings.
- (4) Align seat back cover with hook and loop fasteners and secure.
- (5) Roll cover downward.
- (6) Engage J-strap at base of seat back.
- (7) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

**NOTE:** The taller head restraint release button cap is positioned on the left hand side and the head restraint button cap with the hidden button is positioned on the right hand side.

(8) Position head restraint release button caps on head restraint sleeves and press to secure.

(9) Install head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - INSTALLATION).

## FRONT SEAT CUSHION/COVER

### REMOVAL

- (1) Remove seat from vehicle (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL).
- (2) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (3) Disengage J-straps attaching cushion cover to seat cushion frame.
- (4) Disengage hog rings attaching cushion cover to cushion frame at rear of seat along bottom of cushion cover (Fig. 6).
- (5) Roll up edges of cover and route seat function switches through access hole on outboard side of seat cushion, if equipped.
- (6) Disengage seat cushion heater element connector, if equipped.
- (7) Disengage hog rings attaching cover to cushion along cover insert.
- (8) Separate seat cushion cover from seat cushion.

**Fig. 6 SEAT CUSHION COVER**

- 1 - HOG RING  
2 - CUSHION COVER

### INSTALLATION

- (1) Position seat cover on cushion.
- (2) Engage hog rings attaching cushion cover to cushion along insert.
- (3) Engage seat cushion heater element connector, if equipped.
- (4) Route seat function switches through access hole on outboard side of seat cushion, if equipped.
- (5) Engage J-straps attaching cushion cover to seat cushion frame.

## FRONT SEAT CUSHION/COVER (Continued)

(6) Engage hog rings attaching cushion cover to cushion frame.

(7) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

(8) Install seat (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION).

## FRONT SEAT SIDE SHIELD

## REMOVAL

(1) Remove screws attaching side shield to seat frame.

(2) Disconnect wire harness connectors from power seat and power lumbar switches, if equipped.

(3) Separate side shield from seat.

## INSTALLATION

(1) Position side shield on seat.

(2) Connect wire harness connectors to power seat and power lumbar switches, if equipped.

(3) Install screws attaching side shield to seat frame.

## SEAT TRACK &amp; RECLINER ASSEMBLY

## REMOVAL

(1) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).

(2) Disengage J-strap at base of seat back.

(3) Roll seat back cover upward to access bolts attaching recliner to seat back frame.

(4) Remove bolts attaching recliner to seat back frame.

(5) Separate recliner from seat back.

## INSTALLATION

(1) Position recliner on seat back.

(2) Install bolts attaching recliner to seat back frame and tighten to 28 N·m (20 ft. lbs.).

(3) Roll seat back cover downward.

(4) Engage J-strap at base of seat back.

(5) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

## SEAT TRACK ADJUSTER

## REMOVAL

(1) Remove seat (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL).

(2) Remove side shield (Refer to 23 - BODY/SEATS/FRONT SEAT SIDE SHIELD - REMOVAL).

(3) Remove nuts attaching seat track adjuster to seat cushion frame (Fig. 7) and (Fig. 8). Roll cushion trim cover up to access the two front nuts.

(4) Disengage clips attaching wire harness to adjuster.

(5) Disengage seat memory module connector, if equipped.

(6) Separate seat track from seat cushion frame.

80ba7810

**Fig. 7 SEAT TRACK ADJUSTER-POWER**

## SEAT TRACK ADJUSTER (Continued)

808c7a5d

**Fig. 8 SEAT TRACK ADJUSTER - MANUAL**

- 1 - MANUAL RECLINER
- 2 - SEAT CUSHION PAD
- 3 - SEAT BACK FRAME
- 4 - SEAT CUSHION FRAME
- 5 - MANUAL SEAT TRACK ADJUSTER

**INSTALLATION**

- (1) Transfer seat memory module, if equipped.
- (2) Position seat track on seat cushion frame.
- (3) Route harness through frame and engage clips attaching wire harness to adjuster.
- (4) Engage seat memory module connector, if equipped.
- (5) Install nuts attaching seat track adjuster to seat cushion frame and tighten to 28 N·m (20 ft. lbs.).
- (6) Install the side shield (Refer to 23 - BODY/SEATS/Front Seat Side Shield - Installation).
- (7) Install seat (Refer to 23 - BODY/SEATS/Front Seat - Installation).

**REAR HEADREST****REMOVAL**

- (1) Depress head rest release button and lift head rest to full up position.
- (2) Using a small flat blade, depress tab on out-board side head rest release button and using your hand, simultaneously press tab on in-board side head rest release button (Fig. 9) and pull head rest up to separate from seat back.

80b6f0a7

**Fig. 9 HEAD REST**

- 1 - HEAD RESTRAINT
- 2 - FLAT BLADE

**INSTALLATION**

- (1) Position head rest in seat back, press tab on inboard side head rest release button cap and push down head restraint to secure.

## REAR HEADREST RELEASE KNOB

### REMOVAL

- (1) Using a razor knife or equivalent, cut the release knob from the release lever.
- (2) Pull the release knob from the lever (Fig. 10).

### INSTALLATION

- (1) Position the release knob on the lever and press to snap in place.

## REAR HEADREST FOLDING MECHANISM

### REMOVAL

- (1) Remove the head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).
- (2) Remove folding mechanism cover (Fig. 10).
- (3) Remove the screws that secure the head rest bun to the folding mechanism.

80ba7809

**Fig. 10 Rear Seat Head Rest Folding Mechanism**

- 1 - REAR SEAT HEAD REST FOLDING MECHANISM  
 2 - RELEASE KNOB  
 3 - FOLDING MECHANISM COVER

**NOTE:** The folding release knob is always located on the outboard side.

### INSTALLATION

- (1) Position the head rest bun on the folding mechanism and install the screws.
- (2) Install the folding mechanism cover.
- (3) Install the head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).

## REAR HEADREST SLEEVE

### REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Remove head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).
- (3) Remove head rest caps.
- (4) Remove seat back cover (Refer to 23 - BODY/SEATS/REAR SEAT BACK COVER - REMOVAL).
- (5) Rotate head rest sleeve 1/4 turn counter-clockwise to release retaining tab.
- (6) Pull sleeve from seat back frame.

### INSTALLATION

- (1) Position sleeve in seat back frame.
- (2) Rotate head rest sleeve 1/4 turn clockwise to engage retaining tab.
- (3) Install seat back cover (Refer to 23 - BODY/SEATS/REAR SEAT BACK COVER - INSTALLATION).
- (4) Install head rest caps.

**NOTE:** The taller head restraint release button cap is positioned on the left hand side and the head restraint button cap with the hidden button is positioned on the right hand side.

- (5) Install the head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).
- (6) Install the seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

## REAR SEAT BACK

### REMOVAL

- (1) Move rear seat cushions to forward cargo position.
- (2) Remove bolts attaching seatback side support bracket to floor pan (right side) (Fig. 11).
- (3) Tilt seatback forward, and slide it outboard to detach it from pin on center pivot bracket.
- (4) Remove right side (60%) seatback from vehicle.
- (5) Remove bolts attaching seatback side support bracket and center pivot bracket to floor pan (left side).
- (6) Remove left side (40%) seatback from vehicle.

**Fig. 11 Rear Seat Back**

- 1 - SEAT BACK
- 2 - FLOOR PAN
- 3 - CENTER PIVOT BRACKET
- 4 - SIDE SUPPORT BRACKET

### INSTALLATION

- (1) Position left side (40%) seatback in vehicle.
- (2) Position left side support bracket and center pivot bracket with bolt holes aligned and install bolts. Tighten bolts to 50 N·m (37 ft. lbs.) torque.
- (3) Position right side (60%) seatback in vehicle.
- (4) Install seatback onto center pivot bracket pin. Ensure seat back is properly engaged on the center pivot pin.
- (5) Position right side support bracket with bolt holes aligned and install bolts. Tighten bolts to 50 N·m (37 ft. lbs.) torque.
- (6) Return seat cushions to seating position.

## REAR SEAT BACK COVER

### REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Remove head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).
- (3) Remove head restraint caps.
- (4) Disengage J-straps on outboard side of seat back.
- (5) Disengage J-straps at base of seat back.
- (6) Remove push-pin fasteners attaching cover near bottom edge at latch restraint bar locations.
- (7) Remove screws attaching latch release handle to seat back frame.
- (8) Roll seat back cover upward.
- (9) Disengage hook and loop fasteners attaching seat back cover to seat back pad (Fig. 12).
- (10) Roll seat back cover upward and route latch release handle through seat back cover.
- (11) Separate seat back cover from seat back.
- (12) Separate seat back pad from seat back frame.

**Fig. 12 Rear Seat Back Cover**

- 1 - SEAT BACK COVER
- 2 - SEAT BACK PAD
- 3 - HOOK AND LOOP FASTENER

### INSTALLATION

- (1) Position seat back cover and pad on seat back frame.
- (2) Route latch release handle through seat back cover.
- (3) Roll seat back cover partially downward aligning holes in seat back cover for head restraint and latch release handle.
- (4) Roll seat back cover downward align and engage hook and loop fasteners to seat back pad.
- (5) Engage J-straps at base of seat back.
- (6) Engage J-straps on outboard side of seat back.

## REAR SEAT BACK COVER (Continued)

(7) Install push-pin fasteners attaching cover near bottom edge at latch restraint bar locations.

(8) Install screws attaching latch release handle to seat back frame.

(9) Install head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).

(10) Install seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

## REAR SEAT CUSHION

## REMOVAL

(1) Disengage seat cushion at rear by pulling upward on release strap.

(2) Remove bolts attaching seat cushion to floor pan (Fig. 13).

(3) Remove seat cushion from vehicle.

**Fig. 13 Rear Seat Cushion**

- 1 - SEAT CUSHION  
2 - FLOOR PAN

## INSTALLATION

(1) Position seat cushion in vehicle.

(2) Install bolts attaching seat cushion to floor pan. Tighten bolts to 11 N·m (8 ft. lbs.) torque.

(3) Lock seat cushion down by pressing firmly on center then outboard edge of cushion until latch engages.

## REAR SEAT CUSHION COVER

## REMOVAL

(1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - REMOVAL).

(2) From the underside of the seat, disengage J-straps attaching cover to seat cushion base panel.

(3) Remove push-in fasteners attaching cushion cover to seat cushion base panel (Fig. 14).

(4) Roll back cover.

(5) Disengage hog rings attaching cushion cover to seat cushion foam pad.

(6) Separate cushion cover from seat cushion foam pad.

**Fig. 14 Push-in Fasteners**

- 1 - CUSHION COVER  
2 - SEAT CUSHION BASE PANEL  
3 - PUSH-IN FASTENER

## INSTALLATION

(1) Position cushion cover on seat cushion foam pad.

(2) Engage hog rings attaching cushion cover to seat cushion foam pad.

(3) Align cushion cover and engage J-straps attaching cushion cover to seat cushion base panel.

(4) Install push-in fasteners attaching cushion cover to seat cushion base panel.

(5) Install rear seat cushion (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - INSTALLATION).

REAR SEAT CUSHION  
RELEASE LATCH

## REMOVAL

(1) Unlatch seat and pivot seat upward.

(2) Disengage J-strap at seat cushion base panel.

(3) Roll back cushion cover.

(4) Remove screws attaching latch to base panel.

(5) Separate latch from base panel.

## INSTALLATION

(1) Position latch on base panel.

(2) Install screws attaching latch to base panel. Tighten screws to 8 N·m (75 in. lbs.) torque.

(3) Route the cushion release strap from the loop on the latch through the slot in the trim cover.

(4) Engage J-strap at seat cushion base panel.

(5) latch seat.

## FOLDING REAR SEAT BACK LATCH HANDLE

### REMOVAL

- (1) Pull handle to release latch.
- (2) Remove screws attaching release handle to seat back frame.
- (3) Using a small flat blade, disengage retainers securing latch release cable housing to latch release handle.
- (4) Rotate cable end until barrel end aligns with key hole slot in latch release handle.
- (5) Disengage cable barrel end from release handle.
- (6) Separate latch release handle from seat back (Fig. 15).

80ba780a

**Fig. 15 Rear Seat Release Handle**

1 - REAR SEAT FOLDING RELEASE HANDLE

## FOLDING REAR SEAT BACK LATCH/HINGE

### REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/ REAR SEAT BACK - REMOVAL).
- (2) Disengage J-straps on outboard side of seat back.
- (3) Disengage release cable from latch.
- (4) Remove bolts attaching latch/hinge to seat back frame.
- (5) Separate latch/hinge from seat back frame.

### INSTALLATION

- (1) Position latch/hinge on seat back frame.
- (2) Install bolts attaching latch/hinge to seat back frame. Tighten bolts to 50 N·m (37 ft. lbs.) torque.
- (3) Engage latch release cable.
- (4) Engage J-straps on outboard side of seat back.
- (5) Install seat back (Refer to 23 - BODY/SEATS/ REAR SEAT BACK - INSTALLATION).

### INSTALLATION

- (1) Route cable end into latch release handle.
- (2) Rotate cable end until barrel end aligns with key hole slot in latch release handle and insert into handle.
- (3) Engage retainers securing latch release cable housing to latch release handle.
- (4) Position latch release handle in seat back. Ensure seat back cover is properly aligned.
- (5) Install screws attaching release handle to seat back frame.

## STATIONARY GLASS

## TABLE OF CONTENTS

	page		page
<b>DOOR GLASS</b>		INSTALLATION	108
REMOVAL	108	<b>WINDSHIELD</b>	
INSTALLATION	108	REMOVAL	109
<b>QUARTER WINDOW</b>		INSTALLATION	109
REMOVAL	108		

## DOOR GLASS

## REMOVAL

- (1) Place door window fully down.
- (2) Remove waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)
- (3) Remove inner belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/RDR INNER BELT WEATHERSTRIP - REMOVAL)
- (4) Remove bolt attaching bottom of rear glass run channel to door.
- (5) Pull run channel downward and separate from door.
- (6) Remove screws attaching stationary door glass frame to door. (Fig. 1).
- (7) Separate stationary door glass from door.

80b46b2b

Fig. 1 STATIONARY DOOR GLASS

- 1 - STATIONARY DOOR GLASS  
2 - DOOR

## INSTALLATION

- (1) Position stationary door glass in door.
- (2) Install screws attaching stationary door glass frame to door.
- (3) Install glass run channel.
- (4) Install inner belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/RDR INNER BELT WEATHERSTRIP - INSTALLATION)

- (5) Install waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

## QUARTER WINDOW

## REMOVAL

- (1) Cut urethane bonding from around quarter window glass using a suitable sharp cold knife. A pneumatic cutting device can be used if available.

**CAUTION:** Care should be taken when removing the glass to avoid scratching the exterior paint surface.

- (2) Separate glass from vehicle.

## INSTALLATION

**CAUTION:** Open a window before installing glass. This will avoid pressurizing the passenger compartment. If a door or liftgate is slammed before urethane is cured, water leaks can result.

The window opening fence should be cleaned of old urethane bonding material.

- (1) Clean inside of glass with Mopar Glass Cleaner and lint-free cloth.
- (2) Apply clear PVC (vinyl) primer 25 mm (1 in.) wide around edge of glass. Wipe with clean/dry lint-free cloth.

**NOTE:** Make sure primer does not flow passed the black frit.

- (3) Apply black primer 25 mm (1 in.) wide around edge of glass. Allow at least eighteen minutes drying time.

- (4) Apply a 16 mm (0.6 in.) high by 10 mm (0.4 in.) wide triangular bead of urethane around window vinyl border location.

- (5) Position glass into window opening and lock the four clips into place.

## WINDSHIELD

### REMOVAL

- (1) Remove inside rear view mirror.
- (2) Remove cowl cover.
- (3) Remove screws attaching windshield side molding to A-pillar (Fig. 2).
- (4) Remove upper windshield molding.
- (5) Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available (Fig. 3).
- (6) Separate windshield from vehicle.

**Fig. 3 Cut Urethane Around Windshield—Typical**

- 1 - COLD KNIFE  
2 - WINDSHIELD

### INSTALLATION

**WARNING: REVIEW ALL WARNINGS AND CAUTIONS IN THIS GROUP BEFORE PRECEDING WITH INSTALLATION.**

**CAUTION: Open a window before installing windshield. This will avoid pressurizing the passenger**

**compartment. If a door or liftgate is slammed before urethane is cured, water leaks can result.**

The windshield fence should be cleaned of old urethane bonding material. Support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

80500535

**Fig. 2 Windshield**

- 7 - BLOCKER  
8 - STUD  
9 - SUPPORT SPACER  
10 - WINDSHIELD  
11 - ALIGNMENT SPACER

## WINDSHIELD (Continued)

(1) Place replacement windshield into windshield opening. Position glass in the center of the opening against the support spacers. Mark the glass at the support spacers with a grease pencil or masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 4).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 5).

(3) Clean inside of windshield with Mopar Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around edge of windshield. Wipe with clean/dry lint-free cloth.

(5) Apply black-out primer 25 mm (1 in.) wide on top and sides of windshield and 25 mm (1 in.) on bottom of windshield. Allow at least three minutes drying time.

**NOTE: Make sure the clear and black primers do not flow passed the black frit.**

(6) Position windshield spacers on lower fence above support spacers at the edge of the windshield opening (Fig. 2).

(7) Apply a 16 mm (0.6 in.) high by 10 mm (0.4 in.) wide triangular bead of urethane around perimeter of windshield along the inside of the moldings. Apply two beads along the bottom edge.

(8) Install upper molding onto windshield.

(9) Apply fence primer around the perimeter of the windshield opening fence. Allow at least 18 minutes drying time.

(10) With aid of a helper, position windshield over windshield opening. Align reference marks at bottom of windshield to support spacers.

(11) Slowly lower windshield glass to windshield opening fence. Guide top molding into proper position if necessary. Push windshield inward to fence spacers at bottom and until top molding is flush to roof line.

(12) Clean excess urethane from exterior with Mopar Super Clean or equivalent.

(13) Install windshield side moldings.

(14) Install cowl cover and wipers.

(15) Install inside rear view mirror.

(16) After urethane has cured, water test windshield to verify repair.

## SUNROOF

### DESCRIPTION

**WARNING:** Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from a switch located on the mini overhead console. To operate the sunroof the ignition switch must be in the On/Run position. The sunroof has both manual and Express Open modes of operation when opening. To open the sunroof in the Express Open mode, the switch is pressed rearward for less than **1 second**. This causes the sunroof glass to automatically retract and stop at a position slightly forward of full open that reduces low speed wind buffeting. The sunroof can also be opened manually by pressing and holding the switch rearward. Once the switch is held rearward for more than **1 second**, the glass will retract in the manual mode. Releasing the switch at any time during travel will cause the sunroof to stop at the current position.

To close the sunroof from an open position, the switch must be pushed forward and held until the sunroof glass comes to a complete stop. Releasing the switch at any time in this mode will cause the sunroof to stop at the current position.

To vent the sunroof from the closed position, the switch is pushed forward and held. Releasing the switch at any time during travel will cause the sunroof to stop at the current vent position. To reach the fully vented position, continue to hold the switch forward until vent motion stops. To close the sunroof from the vent position, push and hold the switch rearward until the glass comes to a complete stop.

### DIAGNOSIS AND TESTING - SUNROOF

**CAUTION:** The sunroof motor is only to be powered through the vehicle battery and vehicle wire harness. Applying power to the sunroof motor leads will cause failure of the sunroof control unit.

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. Refer to Group 8W, Wiring Diagrams, of this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp high current fuse (battery feed) located in the Power Distribution Center (PDC). Check the cover of the PDC for location of the fuse. Check for correct operation of the sunroof delay relay. Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at battery and ignition pins of the power sunroof express module wiring connector. Refer to Group 8W, Wiring Diagrams, for circuit information. The controller will not

## SUNROOF (Continued)

operate at less than 10 volts. Check the ground at the sunroof express module.

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. During washing high-pressure water may be forced between the glass panel seal and the roof opening. Normally this water will drain.

However, when some type of drying blower system is used, like those found in automatic car washes, the water may not have a chance to drain before the blower forces air between the seal and the roof opening. This causes the water to blow over the edge of the module and onto the headlining.

Refer to (Fig. 1) Sunroof Assembly for exploded view of the sunroof.

SYMPTOM	STEP	POSSIBLE CAUSE
Sunroof squeaks when opening/closing.	1	Identify if the cause is a seal squeak. If seal is worn, replace the seal.
	2	Check seal compression for uniformity in opening, If not uniform, glass is not centered in opening.
	3	Re-center glass by repositioning module in opening.
	4	Identify if mechanism squeaks.
	5	Check for lubrication, re-lube if necessary.
	6	Check for dirt/debris in tracks, clean and re-lube.
	7	Identify if motor squeaks, replace the motor.
Water leaks into the vehicle.	1	Check for a good connection at the drain tubes, re-connect where needed.
	2	Check for plugged/pinched hoses throughout.
	3	Adjust the glass panel. Refer to glass panel adjustments in this section.
	4	Check seal for wear/damage, replace glass as necessary.
Motor inoperative.	1	Check connectors at the motor, switch, control module and power source.
	2	Check for defective control module, replace if necessary.
	3	Replace the motor.
Motor noise when opening/closing.	1	Identify if motor noise, replace motor.
	2	Insure noise is from the motor and not cables, (cable ratcheting).
Grinding noise when opening/closing. (Mechanism noise, scraping.)  (Cable ratcheting.)	1	Identify if the motor is grinding, replace motor.
	2	Check for lubrication in tracks and mechanism, re-lube if necessary.
	3	Check for dirt/debris in tracks, clean and re-lube.
	4	Cables ratchet at the motor pinion; mechanism jammed, fix mechanism and replace cables and motor bracket.
Wind noise when sunroof fully closed.	1	Check seal compression for uniformity in opening, If not uniform, glass is not centered in opening.
	2	Glass not adjusted flush to roof. Refer to glass panel adjustments in this section.
	3	Mechanism not fully closed. A) Motor out of time, re-time motor/mechanism. Refer to glass panel adjustments in this section. B) Cable ratcheting, replace cables and motor bracket.
	4	Seal worn, replace glass.

## SUNROOF (Continued)

SYMPTOM	STEP	POSSIBLE CAUSE
Sunroof will not open/close.	1	Check switch and switch connection.
	2	Check mechanism for binding (result of forcing the glass closed/broken components).
	3	See motor inoperative above.
Sunroof "rattles", anytime, closed/open.	1	Loose attachment screws (module), re-fasten and adjust module.
	2	Loose glass panel, re-fasten and adjust glass panel.
	3	Loose drain channel, refasten/secure to repair.
	4	Broken mechanism, replace the sunroof assembly module.
	5	Mechanism not fully closed. A) Motor out of time, re-time motor/mechanism. Refer to glass panel adjustments in this section. B) Cable ratcheting, replace cables and motor bracket.
	6	Check for sunshade out of track or for sunshade broken slide block.
	7	Loose wind deflector. Replace if broken.
	8	Loose wind deflector spring. Replace if loose.
Sunshade squeaks/rattles, anytime.  -OR- Sunshade force high/low or binding during operation.	1	Sunshade slide blocks out of track(s), put back in tracks.
	2	Missing felt pads on the drain channel, add felt pads.
	3	Felt on the drain channel rolling off, (sunshade rubs on adhesive), replace felt pads.
	4	Slide block binding in sunshade, free-up slide block by actuating a couple times, grease slide block(s) and spring(s).
	5	Broken slide block in sunshade, replace slide block.
	6	Slide block spring missing, replace spring and slide block.
	7	Sunshade interference with drain channel or trim welt, replace trim welt and/or sunshade.
Motor/sunroof control module operation: Auto open doesn't work, or doesn't stop at closed position.	1	After power disconnect or replacement, sunroof module has to complete on full cycle to program the sunroof control module. Full cycle = close > open > close > vent > close.

## DRAIN TUBE

### REMOVAL

- (1) Remove the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
- (2) Disengage clamps attaching drain tube to sunroof (Fig. 2).
- (3) Tape the end of the old drain tube to the new drain tube. Ensure that the tape build up on the tube ends is not excessive.
- (4) Remove front/rear trim panels as necessary to disengage clamps securing drain tube to body.
- (5) Remove the drain tube plug from the underside of the vehicle.
- (6) From the underside of the vehicle carefully, pull/route the drain tube through the body panel. Applying a soapy water solution to the new tube may aid in this procedure.

### INSTALLATION

- (1) Install the plug adapter to the bottom of the drain tube.

- (2) Engage clamps securing drain tube to body (Fig. 2).
- (3) Install front/rear trim panels as necessary.
- (4) Install drain tube to sunroof and engage clamp.
- (5) Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)

## CONTROL MODULE

### REMOVAL

- (1) Move the glass panel to the fully closed position.
- (2) Remove the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
- (3) Remove the sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)
- (4) Remove the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL)
- (5) Lower headliner as necessary to gain access to the sunroof express module.
- (6) Disconnect the express module wire harness connectors.
- (7) Remove express module screw.

SUNROOF DRAIN HOSE ROUTING

80b9a524

**Fig. 2 Sunroof Drain Hose Routing**

1 - DRAIN HOSE  
2 - CLAMPS  
3 - PLUG

4 - FLOOR  
5 - CLAMPS  
6 - DRAIN HOSE

## CONTROL MODULE (Continued)

(8) Remove express module from the keyway by sliding module towards the center of the vehicle.

## INSTALLATION

(1) Insert sunroof express module in the keyway located in the sunroof module and slide the module outward to lock it into position.

(2) Install the sunroof express module screw.

(3) Connect the wire connectors to the sunroof express module.

(4) Install the headliner into position.

(5) Install the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION)

(6) Install the sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)

(7) Install the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

(8) Test sunroof operation, adjust if necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

## DRIVE MOTOR

## REMOVAL

**CAUTION:** The sunroof system is timed from the factory so that the motor shuts off automatically when the sunroof window reaches a certain position. Extreme care must be taken when removing the motor, timing may be thrown off causing possible damage to the sunroof system. Anytime the motor is removed from the sunroof assembly the sunroof glass panel must be in the **FULLY CLOSED POSITION** or the unit will be out of timing. The drive motor cannot be reset to the park position after being removed.

**CAUTION:** The sunroof motor should only be powered through the vehicle battery and sunroof wire harness. Applying power to the sunroof motor leads will cause failure of the control module.

(1) Move glass panel to the fully closed position.

(2) Remove the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)

(3) Remove the B-pillar upper trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)

(4) Remove the C-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(5) Remove the D-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL)

(6) Remove the sunvisors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)

(7) Remove the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL)

(8) Disconnect the control switch wire connector.

(9) Remove headliner as necessary to gain access to sunroof drive motor. Refer to Headliner Removal and Installation for proper procedures.

(10) Disconnect the drive motor wire harness connectors (Fig. 3).

(11) Remove drive motor fasteners and remove motor from the sunroof housing.

**Fig. 3 Sunroof Drive Motor and Express Module**

1 - EXPRESS MODULE

2 - SCREW

## INSTALLATION

(1) Ensure that the window is in the fully closed position before mounting the motor. If motor fails with the window in the open position the sunroof glass panel timing will have to be timed. The new motor comes in the fully closed position and with a gage for setting cable timing. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS - TIMING)

(2) Place drive motor into position on the sunroof housing and install fasteners.

(3) Connect express module, drive motor, and control switch wire connectors.

(4) Set headliner into position.

(5) Test sunroof operation, adjust as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

(6) Finish installing the headliner.

(7) Connect the control switch wire connector.

(8) Install the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION)

(9) Install the sunvisors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)

(10) Install the D-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION)

(11) Install the C-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

## DRIVE MOTOR (Continued)

(12) Install the B-pillar upper trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)

(13) Install the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

## WIND DEFLECTOR

## REMOVAL

- (1) Open sunroof glass panel.
- (2) Push down one corner of the wind deflector and let the other corner rise up (Fig. 4).
- (3) Push the low corner towards the opposite side of the vehicle until tab on sunshade clears the body. Then raise the corner up.
- (4) Repeat the procedure to the other corner.
- (5) Lift wind deflector to 90% of the way.
- (6) Push the attaching ends of the deflector to the rear of the vehicle to disengage the deflector.

**Fig. 4 Wind Deflector**

1 - WIND DEFLECTOR  
2 - TAB

## INSTALLATION

- (1) Place wind deflector at 90% in the vertical position to the sunroof. With the sunroof open.
- (2) Push ends of the deflector towards the front of the vehicle to engage ends.
- (3) Lower wind deflector to normal position.
- (4) Push one corner to the opposite side of the vehicle until tab clears vehicle body and lower deflector for that corner.
- (5) Push the side that was just installed completely down.
- (6) Push the opposite corner cross vehicle until tab clears the body. Then lower deflector to position.
- (7) Test sunroof operation.

## GLASS PANEL

## REMOVAL

- (1) Slide sunshade rearward to the open position.
- (2) Move the glass panel to the fully closed position.
- (3) Remove the four attaching screws (Fig. 5).
- (4) Lift off glass panel and remove from vehicle.

**Fig. 5 Sunroof Glass Panel Removal**

1 - ATTACHING SCREW

## INSTALLATION

**NOTE:** Sunroof glass must be set in place and attached as close as possible to flush with the roof surface. For wind noise reasons, care must be taken to ensure that the glass is not remounted either a) Overflush to the roof surface at the front edge of the glass, or b) Underflush to the roof surface at the rear edge of the glass.

- (1) Position glass panel in to opening.
- (2) Start the four attaching screws.
- (3) Tighten screws.
- (4) Verify sunroof operation and alignment. Check fit and adjust as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS - FIT)

## ADJUSTMENTS

## ADJUSTMENTS - FIT

- (1) Move the sunshade rearward to the open position.
- (2) Move the sunroof glass panel to the fully closed position.
- (3) Loosen the forward screws on each side enough to make the front adjustment.

## GLASS PANEL (Continued)

(4) Adjust the front of the sunroof glass panel 1 mm (1/32 inch) below the top surface of the roof panel.

(5) Tighten the front two screws.

(6) Loosen the rear screws on each side enough to make the rear adjustment.

(7) Adjust the rear of the sunroof glass panel 1 mm (1/32 inch) above the top surface of the roof panel.

(8) Tighten the rear two screws.

(9) Check for proper fit. If not OK, repeat glass panel adjustment.

## ADJUSTMENT - TIMING

**NOTE:** A gage comes with the new motor.

(1) If the glass panel was not in the fully closed position, when the motor was removed, the sunroof glass panel needs to be timed, before the new motor is installed.

(2) Remove sunroof glass panel.

(3) Set gage into the track near the rear of the opening between the driver slide and the bracket (Fig. 6).

(4) Move the driver slide forward or aft to get proper setting.

(5) Repeat the operation on the other side.

(6) Install drive motor.

80b34e19

**Fig. 6 Sunroof Drive Cable Timing**

- 1 - MOVE DRIVER SLIDE FORWARD/AFT  
2 - GAGE

## SUNSHADE

## REMOVAL

(1) Open sunroof approximately 50% of the way.

(2) Push sunshade down until tabs clear glass.

(3) Move sunshade forward of glass panel.

(4) Compress the spring loaded plungers holding the guide blocks in the track.

(5) Slide the sunshade forward while lifting the front through the opening until the rear guide blocks are accessible.

**CAUTION:** Use care not to crease the sunshade when removing or installing.

(6) Disengage rear guide blocks from track.

## INSTALLATION

(1) Install the sunshade from outside of the vehicle with the sunroof fully open.

(2) Put rear guide blocks into sunshade guide track.

(3) Push sunshade back and down through the sunroof opening.

(4) Using a flat blade tool, put front guide blocks into the sunshade track. By pushing the block towards the center of the vehicle.

(5) Move the glass panel to approximately halfway to the fully closed position.

(6) Push sunshade down until the sunshade clears the glass then move sunshade rearward behind the glass panel.

## HOUSING ASSEMBLY

### REMOVAL

- (1) Move glass panel to the fully closed position.
- (2) Disconnect battery negative cable.
- (3) Recline both front seats.
- (4) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
- (5) Disconnect the drain tubes from sunroof housing (Fig. 7).
- (6) Loosen fasteners attaching sunroof housing assembly.
- (7) With the aid of a helper, remove fasteners attaching sunroof housing assembly to roof panel.

**Fig. 7 SUNROOF ASSEMBLY**

80b9a523

- 1 - ROOF
- 2 - DRAIN HOSE
- 3 - CLAMP
- 4 - SUNROOF ASSEMBLY
- 5 - CLAMP
- 6 - DRAIN HOSE

### INSTALLATION

- (1) Raise the sunroof housing assembly and guide into position and start fasteners (Fig. 7).
- (2) Tighten the fasteners, front to rear, attaching the sunroof module to roof panel. Tighten the fasteners, front to rear, to 11 N·m (97 in. lbs.) torque.
- (3) Connect the drain tubes to the sunroof housing.
- (4) Set headliner into position.
- (5) Connect express module, drive motor, and control switch wire connectors.
- (6) Test sunroof operation, adjust as necessary.
- (7) Finish installing the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
- (8) Connect battery negative cable.

## SUNSHADE - SLIDE BLOCK AND SPRING

### REMOVAL

- (1) Remove sunshade. (Refer to 23 - BODY/SUNROOF/SUNSHADE - REMOVAL)
- (2) Compress guide block locking tabs to remove the old block and spring (Fig. 8).

8108058c

**Fig. 8 SUNSHADE GUIDE BLOCK AND SPRING**

- 1 - Sunshade Guide Block (Replace)
- 2 - Sunshade
- 3 - Guide Block Locking Tabs
- 4 - Guide Block Spring (Replace)

### INSTALLATION

**NOTE: MAKE CERTAIN THAT BOTH GUIDE BLOCK AND SPRING ARE REPLACED.**

- (1) Install guide block and spring assemblies.
- (2) Install the sunshade. (Refer to 23 - BODY/SUNROOF/SUNSHADE - INSTALLATION)

B-PILLAR DOOR SEAL

REMOVAL

The B-pillar seal is attached to the rear door with adhesive tape.

- (1) Peel seal from the door (Fig. 1).

80b46b1e

Fig. 1 B-Pillar Seal

INSTALLATION

- (1) Clean contact area with Mopar® Super Kleen or equivalent.
- (2) Remove carrier from seal.
- (3) Align seal on door and press into place.

## COWL WEATHERSTRIP

### REMOVAL

- (1) Raise hood.
- (2) Pull cowl plenum seal from cowl.
- (3) Separate cowl plenum seal from cowl (Fig. 2).

**Fig. 2 Cowl Plenum Seal**

1 - PLENUM SEAL

### INSTALLATION

- (1) Position cowl plenum seal on cowl.
- (2) Press cowl plenum seal to seat.

## FRONT DOOR GLASS RUN CHANNEL WEATHERSTRIP

### REMOVAL

- (1) Remove the front door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)
- (2) Grasp seal from upper run channel corner and firmly pull weatherstrip from flange and run channel (Fig. 3).
- (3) Remove the glass run from below the belt channels & separate from the door.

### INSTALLATION

**NOTE:** Soapy water may be used to aid in installation.

- (1) Position weatherstrip in channel aligning upper rear corner.
- (2) Press weatherstrip into position.
- (3) Press weatherstrip into lower glass run channels.
- (4) Install front door speaker.
- (5) Install the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

**Fig. 3 FRONT DOOR GLASS RUN CHANNEL WEATHERSTRIP**

1 - GLASS RUN CHANNEL WEATHERSTRIP  
2 - DOOR

## FRONT DOOR INNER BELT WEATHERSTRIP

### REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Using a trim stick or other suitable device, carefully pry up inner edge of seal (Fig. 4).
- (3) Grasp the edge of the seal and pull upward to remove seal from door flange.

**Fig. 4 Inner/Outer Belt Weather Strip**

1 - INNER BELT WEATHERSTRIP  
2 - OUTER BELT WEATHERSTRIP

### INSTALLATION

- (1) Position the seal on the door flange.
- (2) Firmly press downward to seat seal on the door flange.
- (3) Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## FDR OUTER BELT WEATHERSTRIP

### REMOVAL

- (1) Lower the door glass.
- (2) Using a trim stick C-4755 or equivalent, pry seal up from flange. (Fig. 4)
- (3) Pull the seal rearward to release from the side view mirror bezel.
- (4) Lift seal and separate from door panel.

### INSTALLATION

- (1) Position seal on the door panel.
- (2) Push the seal forward to install under the side view mirror bezel.
- (3) Using a mallet or equivalent, tap seal into place.
- (4) Raise the door glass.

## FLIP-UP GLASS WEATHERSTRIP

### REMOVAL

- (1) Remove the liftgate trim panel screws at the window opening.
- (2) Raise flip up glass.
- (3) Carefully pull the seal away from the flange around the edge of the glass opening (Fig. 5).
- (4) Remove it from the vehicle.

**Fig. 5 FLIP-UP GLASS WEATHERSTRIP**

1 - WEATHERSTRIP  
2 - LIFTGATE W/FLIP-UP GLASS

### INSTALLATION

- (1) Thoroughly clean the surface of the flange as necessary.
- (2) Align the weather strip seal with the window opening corners.
- (3) Firmly seat the seal around the entire flange. Join the seal ends together and smooth out any remaining length.
- (4) Weatherstrip break should be 120mm left of latch opening.
- (5) Install the liftgate trim panel screws.

## FRONT DOOR SECONDARY WEATHERSTRIP

### REMOVAL

The front door secondary weatherstrip is attached to the door shutface with push-in fasteners.

- (1) Open door.
- (2) Using a trim panel removal tool, remove push-in fasteners attaching secondary weatherstrip to door shutface (Fig. 6).
- (3) Separate secondary weatherstrip from door.

80b46b2e

**Fig. 6 Front Door Secondary Weatherstrip**

1 - SECONDARY WEATHERSTRIP

### INSTALLATION

- (1) Clean contact area as necessary.
- (2) Position secondary weatherstrip on door shutface.
- (3) Install push-in fasteners attaching secondary weatherstrip to door shutface.

## FRONT DOOR WEATHERSTRIP

### REMOVAL

- (1) Remove A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
- (2) Remove B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
- (3) Remove B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
- (4) Pull weatherstrip from door opening flange.

### INSTALLATION

- (1) Apply three 12 inch strips of foam tape to the flange in the areas shown. (Fig. 7)
- (2) Position weatherstrip at corners.
- (3) Move upward and around edge of door opening seating weatherstrip onto flange (Fig. 8).
- (4) Engage connector plug with each end of weatherstrip at bottom of door opening.
- (5) Install B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
- (6) Install B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).
- (7) Install A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

80ff5800

**Fig. 7 SEAL TAPE**

- 2 - REAR DOOR FOAM TAPE (3 12 in. STRIPS)

80b46b4c

**Fig. 8 Door Opening**

- 1 - REAR DOOR OPENING WEATHERSTRIP
- 2 - FRONT DOOR OPENING WEATHERSTRIP

## HOOD SEAL

### REMOVAL

- (1) Raise hood.
- (2) Pull hood seal from upper radiator crossmember.
- (3) Separate seal from upper radiator crossmember (Fig. 9).

80b46b4e

**Fig. 9 Hood Seal**

- 1 - HOOD SEAL

### INSTALLATION

- (1) Position seal on upper radiator crossmember.
- (2) Press seal onto upper radiator crossmember to seat.

## LIFTGATE OPENING WEATHERSTRIP

### REMOVAL

- (1) Remove the liftgate scuff plate trim. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL)
- (2) Pull seal away from flange around edge of liftgate opening.
- (3) Separate weatherstrip from opening (Fig. 10).
- (4) Clean weatherstrip flange as necessary.

**Fig. 10 LIFTGATE OPENING WEATHERSTRIP**

- 1 - LIFTGATE  
2 - WEATHERSTRIP

### INSTALLATION

- (1) Position weatherstrip in opening with left end of seal at opening centerline.
- (2) Press weatherstrip onto flange in a clockwise direction.
- (3) Center and butt weatherstrip ends together at centerline.
- (4) Install the liftgate scuff plate trim. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - INSTALLATION)

## RDR INNER BELT WEATHERSTRIP

### REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Using a trim stick, carefully pry rear inner edge of inner belt weatherstrip upward.
- (3) Grasp weatherstrip and pull upward to separate from door flange (Fig. 11).

80b46b1c

**Fig. 11 Rear Door Inner/Outer Belt Weatherstrip**

- 1 - INNER BELT WEATHERSTRIP  
2 - OUTER BELT WEATHERSTRIP

### INSTALLATION

- (1) Position weatherstrip on door flange.
- (2) Firmly press downward to seat weatherstrip on flange.
- (3) Install trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

## RDR OUTER BELT WEATHERSTRIP

### REMOVAL

- (1) Remove trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Using a small flat blade, disengage tangs attaching outer belt weatherstrip to inner door panel.
- (3) Lift weatherstrip upward and separate from door (Fig. 11).

### INSTALLATION

- (1) Position the weatherstrip onto the door flange.
- (2) Force the weatherstrip onto door flange and engage tangs. Continue rearward until it is seated on flange.
- (3) Install trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

## RDR SECONDARY WEATHERSTRIP

### REMOVAL

The rear door secondary weatherstrip is attached to the door shutface with push-in fasteners.

- (1) Open door.
- (2) Using a trim panel removal tool, remove push-in fasteners attaching secondary weatherstrip to door shutface.
- (3) Separate secondary weatherstrip from door (Fig. 12).

80b46b1b

**Fig. 12 Rear Door Secondary Weatherstrip**

1 - SECONDARY WEATHERSTRIP

### INSTALLATION

- (1) Clean contact area as necessary.
- (2) Position secondary weatherstrip on door shutface.
- (3) Install push-in fasteners attaching secondary weatherstrip to door shutface.

## REAR DOOR WEATHERSTRIP

### REMOVAL

- (1) Remove C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
- (2) Remove B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
- (3) Remove B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
- (4) Remove screws at front of quarter trim panel.
- (5) Pull weatherstrip from door opening flange.

### INSTALLATION

- (1) Apply three 12 inch strips of foam tape to the flange in the areas shown. (Fig. 13)
- (2) Position weatherstrip at corners.
- (3) Move upward and around edge of door opening seating weatherstrip onto flange (Fig. 8).
- (4) Engage connector plug with each end of weatherstrip at bottom of door opening.
- (5) Install screws at front of quarter trim panel.
- (6) Install B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
- (7) Install B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).
- (8) Install C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

80ff5800

**Fig. 13 SEAL TAPE**

1 - FRONT DOOR FOAM TAPE (3 12 in. STRIPS)  
2 - REAR DOOR FOAM TAPE (3 12 in. STRIPS)

## ROOF RAIL WEATHERSTRIP / RETAINER

### REMOVAL

- (1) Open front and rear doors.
- (2) Remove secondary seal from retainer to access the screws holding the retainer to the A pillar and roof panel.
- (3) Remove the screws holding the retainer in place (Fig. 14).
- (4) Remove the retainer.

### INSTALLATION

- (1) Position the retainer on the A pillar and roof panel.
- (2) Align the screw holes and install the screws.
- (3) Install secondary seal.

**Fig. 14 Upper Body Seal With Retainer**

## HEATING & AIR CONDITIONING

### DESCRIPTION

#### DESCRIPTION - COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating-air conditioning system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Cooling for more information before opening, or attempting any service to the engine cooling system.

#### DESCRIPTION - HEATER AND AIR CONDITIONER

A manual temperature control type heating-air conditioning system is standard factory-installed equipment on this model. An electronically controlled Automatic Zone Control (AZC) type heating-air conditioning system is an available factory-installed option.

All vehicles are equipped with a common HVAC housing assembly (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel.

**Fig. 1 Blend-Air HVAC System - (typical)**

- 4 - Blower Assembly
- 5 - Recirculation Door
- 6 - Evaporator Probe
- 7 - Heater Core
- 8 - Heat/Defrost Door
- 9 - Panel/Defrost Door

#### DESCRIPTION - REFRIGERANT SYSTEM SERVICE PORT

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

## HEATING &amp; AIR CONDITIONING (Continued)

## OPERATION

## OPERATION - HEATER AND AIR CONDITIONER

Outside fresh air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the HVAC system blower housing. Air flow velocity can then be adjusted with the blower motor speed selector switch on the a/c heater control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the HVAC system to receive a sufficient volume of outside air.

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the HVAC housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during HVAC system operation.

Both the manual and AZC heater and air conditioner are blend-air type systems. In a blend-air system, a blend door controls the amount of unconditioned air (or cooled air from the evaporator) that is allowed to flow through, or around, the heater core. A temperature control knob on the a/c heater control panel determines the discharge air temperature by energizing the blend door actuator, which operates the blend door. This allows an almost immediate control of the output air temperature of the system. The AZC system will have separate blend doors and temperature controls for each front seat occupant.

The mode control knob on the a/c heater control panel is used to direct the conditioned air to the selected system outlets. On manual temperature control systems, the mode control knob switches engine vacuum to control the mode doors, which are operated by vacuum actuators. On AZC systems, the mode control knob switches electrical current to control the mode doors, which are operated by electronic actuators.

The outside air intake can be shut off on manual temperature control systems by selecting the Recirculation Mode with the mode control knob. The outside

air intake can be shut off on Automatic Zone Control (AZC) type system by pushing the Recirculation Mode button. This will operate the recirculation door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a thermal expansion valve to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, the system utilizes an evaporator thermister probe with the appropriate operating logic located in the body control module (BCM).

## OPERATION - REFRIGERANT SYSTEM SERVICE PORT

The high pressure service port is located on the liquid line near the receiver/drier. The low pressure service port is located on the suction line near the evaporator at the rear of the engine compartment.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - A/C PERFORMANCE

The air conditioning system is designed to provide the passenger compartment with low temperature and low specific humidity air. The evaporator, located in the HVAC housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the Recirculation Mode. With the system in the Recirculation Mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

## HEATING &amp; AIR CONDITIONING (Continued)

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

If the vehicle has the optional Automatic Zone Control (AZC) system, and has intermittent operational problems or fault codes, be certain that the wire harness connectors on the HVAC housing are properly seated (Fig. 2). To check this condition, unplug the two wire harness connector halves, then plug them in again.

Before performing the following procedure, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING). The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) If the vehicle has the standard manual temperature control, set the A/C Heater mode control switch knob in the Panel position, the temperature control knob in the full cool (Fresh Air Mode) position, the A/C button in the On position, and the blower motor switch knob in the highest speed position. If the vehicle has the optional AZC, set the A/C Heater mode control switch knob in the Panel position, the temperature control knob in the full cool position, the A/C button in the On position, and the blower motor switch knob in the highest (manual) speed position.

**Fig. 2 HVAC Housing - (rear view)**

- 1 - Instrument Panel
- 2 - Air Intake
- 3 - Expansion Valve
- 4 - HVAC Housing
- 5 - Heater Core Input/Output Ports
- 6 - Instrument Panel Wiring Harness
- 7 - Blower Motor

(3) Start the engine and hold the idle at 1,300 rpm with the compressor clutch engaged.

(4) The engine should be at operating temperature. The doors and windows must be open.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity.

(7) With the compressor clutch engaged, record the discharge air temperature and the compressor discharge pressure.

(8) Compare the discharge air temperature to the Performance Temperature and Pressure chart. If the discharge air temperature is high, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## HEATING &amp; AIR CONDITIONING (Continued)

Performance Temperature and Pressure					
Ambient Air Temperature and Humidity	21° C (70° F @ 80% humidity)	27° C (80° F @ 80% humidity)	32° C (90° F @ 80% humidity)	38° C (100° F @ 50% humidity)	43° C (110° F @ 20% humidity)
Air Temperature at Center Panel Outlet	10 to 13° C (50 to 55° F)	14 to 17° C (58 to 63° F)	15 to 18° C (60 to 65° F)	17 to 20° C (63 to 68° F)	14 to 17° C (58 to 63° F)
Evaporator Inlet Pressure at Charge Port	241 to 276 kPa (35 to 40 psi)	262 to 290 kPa (38 to 42 psi)	269 to 296 kPa (39 to 43 psi)	275 to 303 kPa (40 to 44 psi)	262 to 290 kPa (38 to 42 psi)
Compressor Discharge Pressure	1241 to 1792 kPa (180 to 260 psi)	1380 to 1930 kPa (200 to 280 psi)	1380 to 1930 kPa (200 to 280 psi)	1655 to 2206 kPa (240 to 320 psi)	1567 to 2068 kPa (220 to 300 psi)

Note: The discharge air temperatures will be lower if the humidity is less than the percentages shown.

(9) Compare the compressor discharge pressure to the Performance Temperature and Pressure chart. If the compressor discharge pressure is high, see the Pressure Diagnosis chart.

Pressure Diagnosis		
Condition	Possible Causes	Correction
Rapid compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Plumbing/Diagnosis and Testing - Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.  2. Faulty fuse.  3. Faulty a/c compressor clutch coil.  4. Faulty compressor clutch relay.  6. Faulty a/c high pressure transducer.  7. Faulty Fin Probe. 8. Faulty Powertrain Control Module (PCM).	1. See Plumbing/Diagnosis and Testing - Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.  2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required.  3. See A/C Compressor/Diagnosis and Testing - Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required.  4. See A/C Compressor Clutch Relay/Diagnosis and Testing - Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required.  6. See A/C High Pressure Transducer/Diagnosis and Testing in this group. Test the a/c high pressure transducer and replace, if required.  7. Check for open circuit.  8. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required.

## DIAGNOSIS AND TESTING - HEATER PERFORMANCE

Before performing the following tests, refer to Cooling for the procedures to check the radiator coolant level, serpentine drive belt tension, radiator air flow and the radiator fan operation. Also be certain that the accessory vacuum supply line is connected at the engine intake manifold for the manual temperature control system.

## MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor heat position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the HVAC housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

Temperature Reference				
Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

If the floor outlet air temperature is too low, refer to Cooling to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Cooling for the procedures.

## OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow:

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

## MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A blend door not functioning properly.

## TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob(s) on the A/C Heater control panel, the following could require service:

- The A/C heater control.
- The blend door actuator(s).
- The wire harness circuits for the A/C heater control or the blend door actuator(s).
- The blend door(s).
- Improper engine coolant temperature.

## CONTROLS

### DIAGNOSIS AND TESTING - VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the standard equipment manual temperature control system HVAC housing. Testing of the A/C Heater mode control switch operation will determine if the vacuum and electrical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or a faulty vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem isn't a disconnected vacuum supply tube at the engine intake manifold vacuum tap or the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707-B) and a suitable vacuum pump to test the HVAC vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 1), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

### VACUUM CHECK VALVES

(1) Remove the vacuum check valve to be tested. The valves are located in the (black) vacuum supply tubes at either the engine intake manifold vacuum tap, or on the bottom of the HVAC unit behind the passenger front floor duct.

(2) Connect the test set vacuum supply hose to the A/C Heater control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow

J9324-75

**Fig. 1 ADJUST VACUUM TEST BLEED VALVE - TYPICAL**

- 1 - VACUUM PUMP TOOL C-4289
- 2 - VACUUM TEST SET C-3707
- 3 - BLEED VALVE
- 4 - PROBE

through the valve without restriction. If not OK, replace the faulty valve.

### A/C HEATER CONTROL

(1) Connect the test set vacuum probe to the HVAC vacuum supply (black) tube in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

(2) Place the A/C Heater mode control switch knob in each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See the procedure in Locating Vacuum Leaks.

**CAUTION:** Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.

## CONTROLS (Continued)

## LOCATING VACUUM LEAKS

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect the vacuum harness connector from the back of the A/C Heater mode control switch on the control panel.

(2) Connect the test set vacuum hose probe to each port in the vacuum harness connector, one at a time, and pause after each connection (Fig. 2). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty mode control switch. If not OK, go to Step 3.

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, refer to the Vacuum Circuits chart (Fig. 3).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components.

J9324-60

**Fig. 2 VACUUM CIRCUIT TEST**

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (1/8-inch) inside diameter rubber hose.

## A/C COMPRESSOR CLUTCH

### DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 4). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed to the compressor shaft and secured with a bolt.

J9524-33

**Fig. 4 COMPRESSOR CLUTCH - TYPICAL**

- 1 - CLUTCH PLATE
- 2 - SHAFT KEY
- 3 - PULLEY
- 4 - COIL
- 5 - CLUTCH SHIMS
- 6 - SNAP RING
- 7 - SNAP RING

### OPERATION

The compressor clutch components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the a/c switch on the a/c heater control panel, the Automatic Zone Control (AZC) control module (if the vehicle is so equipped), the evaporator probe, the a/c high pressure transducer, the a/c compressor clutch relay, the body control module (BCM) and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Electronic Control Modules for more information on the PCM controls.

### DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, refer to the appropriate wiring diagrams. The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the a/c heater mode control switch in any a/c mode, the a/c heater control a/c switch in the ON position, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRBIII® scan tool and the appropriate diagnostic information for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- A/C heater mode control switch
- A/C compressor clutch relay
- A/C high pressure transducer
- A/C evaporator probe
- Powertrain Control Module (PCM)
- Body Control Module (BCM)

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

## A/C COMPRESSOR CLUTCH (Continued)

**STANDARD PROCEDURE - COMPRESSOR CLUTCH BREAK-IN**

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C Heater control in the Recirculation Mode, the A/C button in the on position, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

**REMOVAL**

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the serpentine drive belt. Refer to Cooling for the procedures.

(3) Remove the bolt that secures the compressor clutch to the compressor shaft (Fig. 5). A band-type oil filter wrench may be used to secure the clutch during bolt removal.

**Fig. 5 COMPRESSOR SHAFT BOLT**

- 1 - COMPRESSOR CLUTCH PLATE
- 2 - COMPRESSOR SHAFT BOLT

(4) Tap the clutch plate with a plastic mallet to release it from the splines on the compressor shaft. Remove the clutch plate and shim(s) from the compressor shaft (Fig. 6).

**CAUTION:** Do not pry between the clutch plate assembly and the pulley to remove it from the compressor shaft. Prying may damage the clutch plate assembly.

**Fig. 6 CLUTCH PLATE AND SHIM(S)**

- 1 - COMPRESSOR SHAFT
- 2 - CLUTCH PLATE
- 3 - CLUTCH PLATE SHIM

(5) Remove the external snap ring that secures the compressor clutch pulley to the nose of the compressor front housing with snap ring pliers (Special Tool C-4574) and slide the pulley assembly off of the compressor (Fig. 7).

**Fig. 7 PULLEY SNAP RING**

- 1 - SNAP RING

## A/C COMPRESSOR CLUTCH (Continued)

(6) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing.

(7) Remove the external snap ring that secures the compressor clutch coil to the nose of the compressor front housing with snap ring pliers and slide the coil assembly off of the compressor (Fig. 8).

**Fig. 8 CLUTCH COIL SNAP RING**

- 1 - SNAP RING PLIERS
- 2 - CLUTCH COIL
- 3 - SNAP RING
- 4 - COMPRESSOR

## INSPECTION

Examine the friction surfaces of the clutch pulley and the clutch plate for wear. The pulley and plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for refrigerant oil. Remove the felt wick from around the shaft inside the nose of the compressor front housing. If the felt is saturated with refrigerant oil, the compressor shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

## INSTALLATION

(1) Align the dowel pin on the back of the clutch field coil with the hole in the compressor front housing and press the field coil into place over the nose of the compressor.

(2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.

(3) Install the clutch field coil and snap ring with snap ring pliers (Special Tool C-4574). The bevel side of the snap ring must be facing outward. Also, both eyelets of the snap ring must be to the right or left of the pin on the compressor. Press in on the snap ring to be certain that it is properly seated in the groove.

**CAUTION:** If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(4) Install the pulley assembly onto the compressor. If necessary, place a block of wood on the friction surface and tap gently with a hammer (Fig. 9).

**CAUTION:** Do not mar the pulley friction surface.

**Fig. 9 PULLEY ASSEMBLY INSTALL**

- 1 - PULLEY ASSEMBLY
- 2 - WOOD BLOCK

(5) Install the pulley assembly retaining snap ring (bevel side outward) with snap ring pliers (Special Tool C-4574). Press in on the snap ring to be certain that it is properly seated in the groove.

(6) If the original clutch plate assembly and pulley assembly are to be reused, the old shim(s) can be used. If not, place a stack of shim(s) equal to the old shim(s) on the shaft against the shoulder.

(7) Install the clutch plate assembly onto the shaft.

## A/C COMPRESSOR CLUTCH (Continued)

(8) With the clutch plate assembly tight against the shim(s), measure the air gap between the clutch plate and the pulley face with feeler gauges. The air gap should be between 0.35 to 0.65 millimeter (0.014 to 0.026 inch). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.

(9) Install the compressor shaft bolt. Tighten the bolt to 13 N·m (115 in. lbs.).

**NOTE:** The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is still correct. Spin the pulley before performing a final check of the air gap.

(10) To complete the installation, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION)

## A/C COMPRESSOR CLUTCH RELAY

## DESCRIPTION

The compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

## OPERATION

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the a/c compressor switch on the a/c heater control panel, the Automatic Zone Control (AZC) control module (if the vehicle is so equipped), the a/c fin probe, and the a/c high pressure transducer. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH RELAY - DIAGNOSIS AND TESTING)

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY

For circuit descriptions and diagrams, refer to the appropriate wiring information.

The compressor clutch relay (Fig. 10) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be  $75 \pm 5$  ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see the Relay Circuit Test procedure in this group. If not OK, replace the faulty relay.

**Fig. 10 A/C COMPRESSOR CLUTCH RELAY**

30 - COMMON FEED  
85 - COIL GROUND  
86 - COIL BATTERY  
87 - NORMALLY OPEN  
87A - NORMALLY CLOSED

## RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to the appropriate wiring information..

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal cavity (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity

## A/C COMPRESSOR CLUTCH RELAY (Continued)

for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 11).

**Fig. 11 POWER DISTRIBUTION CENTER (PDC)**

- 1 - TRANSMISSION CONTROL MODULE (TCM)
- 2 - NEGATIVE CABLE
- 3 - POSITIVE CABLE
- 4 - POWER DISTRIBUTION CENTER (PDC)

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

## INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

## A/C HEATER CONTROL

## DESCRIPTION

The manual temperature control HVAC system uses a combination of electrical, and vacuum controls. The Automatic Zone Control (AZC) HVAC system uses only electrical controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more information on the suggested operation and use of these controls.

Both a/c heater control panels are located on the instrument panel inboard of the steering column and below the radio (Fig. 12). Both control panels contain rotary-type temperature control knob(s), a rotary-type mode control switch knob, a rotary-type blower motor speed switch knob and an air conditioning compressor push button switch. The rear window defogger push button switch is also located on a/c heater control panel. The AZC control panel also features a recirculation push button switch and a vacuum fluorescent display area.

## MANUAL AIR CONDITIONING SYSTEM

## AUTOMATIC ZONE CONTROL SYSTEM

**Fig. 12 A/C HEATER CONTROL PANELS**

## OPERATION

The AZC control module uses infrared sensing technology to control occupant comfort levels, not the actual passenger compartment air temperature. Dual infrared sensors mounted in the face of the control unit independently measure the surface temperature to maintain customer-perceived comfort temperature under changing conditions. Dual Zone temperature control provides wide side-to-side variation in comfort

## A/C HEATER CONTROL (Continued)

temperature to exceed the needs of either front seat occupant. This sensing system replaces interior air temperature and solar sensors used to approximate direct sensing control through complex control programs.

Both the manual A/C Heater control panel and the AZC control panel are serviced only as complete units and cannot be repaired. If faulty or damaged, the entire control panel unit must be replaced.

## DIAGNOSIS AND TESTING - AUTOMATIC ZONE CONTROL SYSTEM

The Automatic Zone Control (AZC) control module has a system self-diagnostic mode which continuously monitors various parameters during normal system operation. If a system fault is detected, a current and historical fault is recorded. When the current fault is cleared, the historical fault remains until reset (manually or automatically). Both the current and historical fault codes can be accessed through either the front panel, or over the Programmable Communications Interface (PCI) bus using a DRBIII® scan tool, and the appropriate diagnostic information.

The AZC control module is capable of three different types of self-diagnostic tests, as follows:

- Fault Code Tests
- Input Circuit Tests
- Output Circuit/Actuator Tests

The information that follows describes:

- How to read the self-diagnostic display
- How to enter the AZC control module self-diagnostic test mode

- How to select the self-diagnostic test types
- How to perform the different tests

## ENTERING THE AZC SELF-DIAGNOSTIC MODE

To enter the AZC self-diagnostic mode, perform the following:

(1) Depress the a/c and recirc buttons at the same time and hold. Rotate the left temperature control knob clockwise (CW) one detent.

(2) If you continue to keep the a/c and recirc buttons depressed, the AZC control module will perform a Segment Test of the Vacuum Fluorescent (VF) display. In the Segment Test you should see all of the display segments illuminate as long as both buttons are held. If a display segment fails to illuminate, the vacuum fluorescent display is faulty and the a/c heater control must be replaced.

(3) After viewing the Segment Test, release the A/C and Recirc buttons and the display will clear momentarily. **If a 0 is displayed, then no faults are set in the system.** Should there be any faults, either "current" or "historical", all fault codes will be displayed in ascending numerical sequence (note no effort is made to display fault codes in chronological order). Each fault code is displayed for one second before the next code is displayed. Once all fault codes have been displayed, the system will then repeat the fault code numbers. This will continue until the left side set temperature control is moved at least one detent position in the CW direction or the ignition is turned "OFF".

## A/C HEATER CONTROL (Continued)

**FAULT CODE TESTS**

Fault codes are two-digit numbers that identify a circuit that is malfunctioning. There are two different kinds of fault codes.

1. **Current Fault Codes** - Current means the fault is present right now. There are two types of current faults: input faults, and system faults.

2. **Historical Fault Codes** - Historical or stored means that the fault occurred previously, but is not present right now. A majority of historical fault codes are caused by intermittent wire harness or wire harness connector problems.

CURRENT FAULT CODES	
Input faults	01 = IR thermister circuit open
	02 = IR thermister circuit shorted
	03 = Fan pot shorted
	04 = Fan pot open
	05 = Mode pot shorted
	06 = Mode pot open
	07 = IR sensor delta too large
	08 = Reserved
	09 = Reserved
	10 = One of four motor drivers has drive "A" shorted to ground
	11 = Engine air intake temperature Buss message missing
	12 = Country code Buss message missing

CURRENT FAULT CODES	
System Faults	13 = Mode motor not responding
	14 = AI (Recirc) motor not responding
	15 = Left temperature door not responding
	16 = Right temperature door not responding
	17 = Mode door travel range too small
	18 = Mode door travel range too large
	19 = AI (Recirc) door travel too small
	20 = AI (Recirc) door travel too large
	21 = Left temperature door travel too small
	22 = Left temperature door travel too large
	23 = Right temperature door travel too small
	24 = Right temperature door travel too large
	25 = Calibration check sum error
	26 = Engine coolant temp bus message missing
	27 = Vehicle speed bus message missing
	28 = Engine RPM bus message missing
	29 = OAT bus message missing
	30 = Display intensity bus message missing
	31 = VIN number bus message missing
	32 = Raw OAT bus message missing

## A/C HEATER CONTROL (Continued)

HISTORICAL FAULT CODES	
Input faults	33 = IR thermister circuit was open
	34 = IR thermister circuit was shorted
	35 = Fan pot was shorted
	36 = Fan pot was open
	37 = Mode pot was shorted
	38 = Mode pot was open
	39 = IR sensor delta was too large
	40 = Reserved
	41 = Reserved
	42 = One of four motor drivers had drive "A" shorted to ground
	43 = Engine air intake temperature Buss message missing
	44 = Country code Buss message missing
System Faults	45 = Mode motor was not responding
	46 = AI (Recirc) motor was not responding
	47 = Left temperature door was not responding
	48 = Right temperature door was not responding
	49 = Mode door travel range too small
	50 = Mode door travel range too large
	51 = AI (Recirc) door travel range too small
	52 = AI (Recirc) door travel range too large
	53 = Left temperature door travel too small
	54 = Left temperature door travel too large
	55 = Right temperature door travel too small
	56 = Right temperature door travel too large
	57 = Calibration check sum error
	58 = Engine coolant temp bus message missing
	59 = Vehicle speed bus message missing
	60 = Engine RPM bus message missing
	61 = OAT bus message missing
	62 = Display intensity bus message missing
	63 = VIN number bus message missing
	64 = Raw OAT bus message was missing
	65 = Reserved
	66 = Reserved
	67 = Reserved

**NOTE:** A battery disconnect will erase all faults stored in Random Access Memory (RAM) of the AZC control module. It is recommended that all faults be recorded before they are erased.

## RETRIEVING FAULT CODES

(1) To begin the fault code tests, depress the A/C and Recirc buttons at the same time and rotate the left temperature control knob clockwise (CW) one detent, then release the push-button.

## A/C HEATER CONTROL (Continued)

(2) **If there are no fault codes, the "00" display value will remain in the VF window.** Should there be any codes, each will be displayed for one second in ascending numerical sequence (note: no effort is made to display faults in the order they occurred). The left side set temperature display will be blanked and the right side set temperature display will indicate current and historical codes (8 historical max) presently active. Once all codes have been displayed, the system will repeat the fault code numbers. This will continue until the left side set temperature control is moved at least one detent position in either direction, by pressing both the A/C and Recirc buttons at the same time, or the ignition is turned off. Record all of the fault codes, then see the Current and Historical Fault Code charts for the descriptions.

## CLEARING FAULT CODES

Current faults cannot be electronically cleared. Repair must be made to the system to eliminate the fault causing code. Historical fault codes can be cleared manually, or automatically. To clear a historical fault manually, depress and hold either the A/C or Recirc button for at least three seconds while the display is in the fault code mode of operation. Historical fault codes are cleared automatically when the corresponding current fault code has been cleared, and has remained cleared for a number of ignition cycles. The faults have been cleared when two horizontal bars appear in the Test Selector display.

## EXITING SELF-DIAGNOSTIC MODE

The self-diagnostic mode can be exited by pressing both the A/C and Recirc buttons at the same time, or turning off the ignition.

## MONITOR CURRENT PARAMETERS

While in the display fault code mode of operation, current system parameters can also be monitored

and/or forced. Rotating the left side set temperature control clockwise will increase the pointer number while rotating the control counter clockwise will decrease the pointer number. Rotating the right set temperature control will have no impact on pointer value or the value of the parameter being monitored. Once the desired pointer number has been selected, pressing either the AC or Recirc buttons will display the current value of the selected parameter. **The right side set temperature display is only capable of displaying only values ranging from 0 to 99, the left side set temperature display is used for values greater than 99. If the value is less than 99, the left side set temperature display remains blanked.** While a parameter is being overridden, the system will continue to function normally except for the parameter which is being manually controlled.

For values < 0, the "G" segment in the left side set temperature Most Significant Digit (MSD)(or left-most number in the pair) will be used to indicate a negative number. For values between -01 to -99 the Least Significant Digit (LSD)(or right-most number of the pair) in the left side set temperature will remain blank. System control of parameter being displayed can be overridden by rotating the right set temperature control in either direction. Rotating the right temperature control in the CW direction, the selected parameter value is overridden and incremented beginning at the value which was being displayed. Rotating the right temperature control in the CCW direction, the selected parameter value is overridden and decremented beginning at the value which was being displayed. The rate at which incrementing and decrement occurs is one unit value per set temperature detent position.

## A/C HEATER CONTROL (Continued)

## OUTPUT CIRCUIT/ACTUATOR TESTS

In the Output Circuit/Actuator Test mode, the output circuits can be viewed, monitored, overridden, and tested. If a failure occurs in an output circuit, test the circuit by overriding the system. Test the actuator through its full range of operation.

(1) To begin the Output Circuit/Actuator Tests you must be in the Select Test mode.

(2) With a "00" value displayed in the Test Selector and no stick man, turn the rotary temperature control knob until the test number you are looking for appears in the Test Selector display. See the Circuit Testing charts for a listing of the test numbers, test items, test types, system tested, and displayed values.

(3) To see the output value, depress the a/c or recirc button. The values displayed will represent the output from the AZC control module.

(4) To enter the actuator test, depress the a/c or recirc button. Then, rotate the right temperature set knob to the desired position.

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center upper, and center lower bezels from the instrument panel. Refer to Instrument Panel System for the procedures.

(3) Remove the 4 screws that secure the a/c heater control to the instrument panel (Fig. 13).

(4) Pull the a/c heater control assembly away from the instrument panel far enough to access the connections on the back of the control.

(5) Unplug the wire and/or vacuum harness connectors from the back of the a/c heater control (Fig. 14).

(6) Remove the a/c heater control from the instrument panel.

80b9a514

**Fig. 13 A/C HEATER CONTROL REMOVE/INSTALL**

80b9a515

**Fig. 14 A/C HEATER CONTROL CONNECTIONS**

1 - MODE SWITCH  
2 - ELECTRICAL CONNECTIONS  
3 - VACUUM HARNESS

## INSTALLATION

(1) Plug the wire harness and/or vacuum harness connectors into the back of the a/c heater control.

(2) Position the a/c heater control in the instrument panel and secure it with 4 screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Reinstall the center upper, and center lower bezels onto the instrument panel. Refer to Instrument Panel System for the procedures.

(4) Connect the battery negative cable.

## A/C PRESSURE TRANSDUCER

### DESCRIPTION

The A/C pressure transducer is installed on a fitting located on the refrigerant discharge line near the condenser. An internally threaded hex fitting on the transducer connects it to the externally threaded Schrader-type fitting on the discharge line. A rubber O-ring seals the connection between the transducer and the discharge line fitting. Three terminals within a molded plastic connector receptacle on the top of the transducer connect it to the vehicle electrical system through a take out and connector of the headlamp and dash wire harness.

The A/C pressure transducer cannot be adjusted or repaired and if faulty or damaged, it must be replaced.

### OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the discharge line. The transducer will change its internal resistance in response to the pressures it monitors. The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure. The PCM is preprogrammed to respond to this and other sensor inputs by controlling the operation of the air conditioning compressor clutch and the radiator cooling fan to help optimize

air conditioning system performance and to protect the system components from damage. The A/C pressure transducer input to the PCM will also prevent the air conditioning compressor clutch from engaging when the ambient temperatures are below about 0.556° C (33° F) due to the pressure/temperature relationship of the refrigerant. The Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the system. The A/C pressure transducer is diagnosed using the DRBIII® scan tool. Refer to the appropriate diagnostic information.

### DIAGNOSIS AND TESTING - A/C PRESSURE TRANSDUCER

The A/C pressure transducer is tested using a DRBIII® scan tool. Refer to the appropriate diagnostic information. Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the air conditioning system to operate, an A/C pressure transducer voltage reading between 0.7 and 4.56 volts is required. Voltage outside this range indicate a low or high refrigerant system pressure condition to the Powertrain Control Module (PCM). The PCM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the compressor. Refer to the A/C Pressure Transducer Voltage table for the possible condition indicated by the transducer voltage readings.

A/C PRESSURE TRANSDUCER VOLTAGE	
VOLTAGE	POSSIBLE INDICATION
0.0	1. NO SENSOR SUPPLY VOLTAGE FROM PCM. 2. SHORTED SENSOR CIRCUIT. 3. FAULTY TRANSDUCER
0.150 TO 0.450	1. AMBIENT TEMPERATURE BELOW 10° c (50° F). 2. LOW REFRIGERANT SYSTEM PRESSURE.
0.451 TO 4.519	1. NORMAL REFRIGERANT SYSTEM PRESSURE.
4.520 TO 4.850	1. HIGH REFRIGERANT SYSTEM PRESSURE.
5.0	1. OPEN SENSOR CIRCUIT. 2. FAULTY TRANSDUCER.

## A/C PRESSURE TRANSDUCER (Continued)

## REMOVAL

**WARNING:** Transducer can be removed without recovering the system, but some loss of refrigerant can be expected (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

- (1) Disconnect and isolate the battery negative cable.
- (2) Disconnect the headlamp and dash wire harness connector for the A/C pressure transducer from the transducer connector receptacle.
- (3) Using an open end wrench, unscrew the A/C pressure transducer from the fitting on the discharge line.
- (4) Remove the seal from the A/C pressure transducer fitting and discard.

## INSTALLATION

- (1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the A/C pressure transducer fitting.
- (2) Using an open end wrench, install and tighten the A/C pressure transducer onto the fitting on the discharge line.
- (3) Reconnect the headlamp and dash wire harness connector for the A/C pressure transducer to the transducer connector receptacle.
- (4) Reconnect the battery negative cable.

## BLOWER MOTOR CONTROLLER

## DESCRIPTION

Models equipped with the optional Automatic Zone Control (AZC) system have a blower motor controller. The controller allows the selection of almost infinitely variable blower motor speeds. The controller is mounted to the HVAC housing, under the instrument panel and just inboard of the blower motor, in the same location used for the blower motor resistor on manual temperature control systems. It can be accessed without removing any other components.

## OPERATION

The blower motor controller output to the blower motor can be adjusted by the blower motor speed switch knob on the AZC A/C Heater control panel, or it can be adjusted automatically by the logic circuitry and programming of the AZC control module. In either case, the AZC control module sends the correct pulse width modulated signal to the blower motor

controller to obtain the selected or programmed blower motor speed.

The blower motor controller cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Depress locking tab and unplug the wire harness connector from the blower motor controller.
- (3) Depress locking tab and unplug the controller connector from the blower motor.
- (4) Remove the 2 screws that secure the blower motor controller to the HVAC housing.
- (5) Remove the blower motor controller from the HVAC housing (Fig. 15).

80b897c7

**Fig. 15 BLOWER MOTOR CONTROLLER REMOVE/INSTALL**

- 1 - BLOWER MOTOR CONTROLLER
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

## INSTALLATION

- (1) Install the blower motor controller in the HVAC housing. The housing is indexed to allow controller mounting in only one position. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Plug in the wire harness connector to the blower motor controller.
- (3) Plug in the connector from the blower motor controller to the blower motor.
- (4) Connect the battery negative cable.

## BLOWER MOTOR RESISTOR BLOCK

### DESCRIPTION

Models with the standard manual temperature control system have a blower motor resistor. The blower motor resistor is mounted to the bottom of the HVAC housing, under the instrument panel and just inboard of the blower motor. It can be accessed for service without removing any other components.

### OPERATION

The resistor has multiple resistor wires, each of which will reduce the current flow to the blower motor to change the blower motor speed by changing the resistance in the blower motor ground path. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

### DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

For circuit descriptions and diagrams, refer to the appropriate wiring information.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Depress locking tab and unplug the wire harness connector from the blower motor resistor.

(3) Depress locking tab and unplug the resistor connector from the blower motor.

(4) Remove the 2 screws that secure the blower motor resistor to the HVAC housing.

(5) Remove the blower motor resistor from the HVAC housing (Fig. 16).

80b897c7

**Fig. 16 BLOWER MOTOR RESISTOR REMOVE/INSTALL**

- 1 - BLOWER MOTOR RESISTOR
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP - (If Equipped)
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

### INSTALLATION

(1) Install the blower motor resistor in the HVAC housing. The housing is indexed to allow mounting in only one position. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the blower motor resistor.

(3) Plug in the connector from the blower motor resistor to the blower motor.

(4) Connect the battery negative cable.

## BLOWER MOTOR SWITCH

### DESCRIPTION

The A/C Heater blower motor is controlled by a rotary-type blower motor switch, mounted in the A/C Heater control panel. On vehicles with manual temperature control systems, the switch allows the selection of four blower motor speeds, but will only operate with the ignition switch in the On position and the A/C Heater mode control switch in any position, except Off. On vehicles with the Automatic Zone Control (AZC) systems, the switch allows the selection of Lo Auto, Hi Auto, and ten speed settings between Lo and Hi.

### OPERATION

On manual temperature control systems, the blower motor switch is connected in series with the blower motor ground path through the a/c heater mode control switch. The blower motor switch directs this ground path to the blower motor through the blower motor resistor wires, or directly to the blower motor, as required to achieve the selected blower motor speed.

On AZC systems, the blower motor switch is just one of many inputs to the AZC control module. In the manual blower modes, the AZC control module adjusts the blower motor speed through the blower motor controller as required to achieve the selected blower switch position. In the auto blower modes, the AZC control assembly is programmed to select and adjust the blower motor speed through the blower motor controller as required to achieve and maintain the selected comfort level.

The blower motor switch cannot be repaired and, if faulty or damaged, it must be replaced. The switch is serviced only as a part of the a/c heater control assembly.

### DIAGNOSIS AND TESTING - BLOWER MOTOR SWITCH-MANUAL TEMPERATURE CONTROL SYSTEM

For circuit descriptions and diagrams, refer to the appropriate wiring information.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG**

**SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the a/c heater control from the instrument panel. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) Check for continuity between the ground circuit cavity of the a/c heater control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the a/c heater control wire harness connector unplugged, place the a/c heater mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the a/c heater control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the a/c heater control connector and the blower motor resistor as required. If not OK, replace the faulty a/c heater control unit.

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

The blower motor switch cannot be adjusted or repaired, and if faulty or damaged, the a/c heater control must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

## IN-CAR TEMPERATURE SENSOR

### DESCRIPTION

Models equipped with the optional Automatic Zone Control (AZC) system use automatic dual zone temperature control with infrared sensing technology. The temperature sensor is located in the center instrument panel, between the dual temperature knobs of the AZC.

### OPERATION

The Automatic Zone Control uses infrared sensing technology to control occupant comfort levels, not the actual passenger compartment air temperature. Dual infrared sensors mounted in the face of the control unit independently measure the surface temperature to maintain customer-perceived comfort temperature under changing conditions. Dual Zone temperature control provides wide side-to-side variation in comfort temperature to exceed the needs of either front seat occupant. This sensing system replaces interior air temperature and solar sensors used to approximate direct sensing control through complex control programs.

The infrared temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the AZC head must be replaced.

**NOTE:** The infrared sensor window may be permanently damaged if any type of cosmetic vinyl dressings are allowed to contact the lens. Avoid spraying or wiping this area with any cleaner or conditioner. This may result in impaired temperature sensing and control.

### REMOVAL

The infrared temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the AZC head must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

## BLEND DOOR ACTUATOR

### DESCRIPTION

The blend door for all models is actuated by an electric actuator, while the AZC system uses 2 separate actuators to allow the driver and passenger to select individual comfort levels. In the following procedures, service for both types of actuators is covered.

### REMOVAL

#### REMOVAL - Manual & AZC Systems (Driverside only on AZC)

**WARNING:** ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The blend door actuator is used on all models, whether equipped with manual or Automatic Zone Control (AZC). This actuator is located on the front of the HVAC housing to the right of the floor panel transmission tunnel, and can be removed from the passenger compartment without instrument panel or HVAC housing removal.

**NOTE:** This procedure is for Manual systems and AZC systems (Driverside only).

## BLEND DOOR ACTUATOR (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box door.(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)

(3) Remove the lower I/P glove box door surround panel.(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(4) Unplug the wire harness connector from the blend door actuator (Fig. 17).

**Fig. 17 BLEND DOOR ACTUATOR**

1 - BLEND DOOR ACTUATOR  
2 - ELECTRICAL CONNECTOR

(5) Remove the 2 screws that secure the blend door actuator to the HVAC housing.

(6) Remove the blend door actuator from the HVAC housing.

### REMOVAL - AZC System (Passenger side only)

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

The passenger side blend door actuator is used on all models equipped with Automatic Zone Control (AZC). This actuator is located on the front of the

HVAC housing to the right of the floor panel transmission tunnel, and cannot be removed from the passenger compartment without instrument panel or HVAC housing removal.

**NOTE: This procedure is for AZC systems (Passenger side only).**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box door.(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)

(3) Remove the lower I/P glove box door surround panel.(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(4) Remove the dash assembly(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(5) Remove the HVAC assembly(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(6) Unplug the wire harness connector from the blend door actuator (Fig. 18).

**Fig. 18**

(7) Remove the 2 screws that secure the blend door actuator to the HVAC housing.

(8) Remove the blend door actuator from the HVAC housing.

## INSTALLATION

### INSTALLATION - Manual & AZC (Driverside only)

(1) Install the blend door actuator on the HVAC housing and tighten the two mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the blend door actuator.

## BLEND DOOR ACTUATOR (Continued)

(3) Install the glove box door(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(4) Install the lower I/P glove box door surround panel(Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(5) Connect and the battery negative cable.

**INSTALLATION - AZC (Passenger side only)**

(1) Install the blend door actuator on the HVAC housing and tighten the two mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the blend door actuator.

(3) Install the HVAC unit into the vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).

(4) Install the instrument panel assembly into the vehicle(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Evacuate the HVAC system(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(6) Recharge the HVAC system(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(7) Connect and the battery negative cable.

## MODE DOOR ACTUATOR

**DESCRIPTION**

The mode door actuators for vehicles equipped with the standard equipment manual temperature control system are vacuum controlled. The optional Automatic Zone Control (AZC) system uses electric motors to actuate all mode doors. The service procedures for both types of actuators are covered by the following procedures.

**REMOVAL****REMOVAL - HEAT/DEFROST - PANEL/DEFROST DOOR ELECTRIC ACTUATOR**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS**

**IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

These actuators are used only on models equipped with the optional Automatic Zone Control (AZC) system.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the two bolts that secure the center instrument panel support bracket to the left side of the floor panel transmission tunnel.

(3) Remove the two bolts that secure the center instrument panel support bracket to the instrument panel.

(4) Remove the center instrument panel support bracket from the vehicle.

(5) Unplug the wire harness connector from the heat/defrost - panel/defrost door actuator (Fig. 19).

80b897c8

**Fig. 19 HEAT/DEFROST - PANEL/DEFROST DOOR ACTUATOR**

- 1 - LEVER ASSEMBLY
- 2 - LINKAGE
- 3 - ELECTRIC ACTUATOR

(6) Remove the three screws that secure the heat/defrost-panel/defrost door motor to the HVAC housing.

(7) Remove the heat/defrost-panel/defrost door motor from the HVAC housing.

## MODE DOOR ACTUATOR (Continued)

**REMOVAL - HEAT/DEFROST DOOR VACUUM ACTUATOR**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

This actuator is used only on models equipped with the standard manual temperature control system.

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unplug the vacuum harness connector from the heat/defrost door vacuum actuator (Fig. 20).

80b897c5

**Fig. 20 MODE DOOR ACTUATORS-MANUAL SYSTEM**

- 1 - VACUUM LINES
- 2 - ACTUATING LEVERS
- 3 - LINKAGE
- 4 - VACUUM ACTUATORS
- 5 - ACTUATING LEVER

(3) Disengage the heat/defrost door pivot connection from the heat/defrost door pivot pin.

(4) Remove the screws that secure the heat/defrost door vacuum actuator to the HVAC housing.

(5) Remove the heat/defrost door vacuum actuator from the HVAC housing.

**REMOVAL - PANEL/DEFROST DOOR VACUUM ACTUATOR**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

This actuator is used only on models equipped with the standard manual temperature control system.

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unplug the vacuum harness connector from the heat/defrost door vacuum actuator (Fig. 21).

(3) Disengage the panel/defrost door pivot connection from the panel/defrost door pivot pin.

(4) Remove the screws that secure the panel/defrost door vacuum actuator to the HVAC housing.

(5) Remove the panel/defrost door vacuum actuator from the HVAC housing.

**INSTALLATION****INSTALLATION - HEAT/DEFROST - PANEL/DEFROST DOOR ELECTRIC ACTUATOR**

(1) Install the heat/defrost-panel/defrost door actuator on the HVAC housing, and tighten the three mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the heat/defrost - panel/defrost door actuator.

(3) Install the center instrument panel support bracket on the vehicle.

(4) Install the two bolts that secure the center instrument panel support bracket to the instrument panel.

## MODE DOOR ACTUATOR (Continued)

J9324-26

**Fig. 21 PANEL/DEFROST DOOR ACTUATOR**

- 1 - VACUUM LINE  
 2 - PANEL/DEFROST DOOR ACTUATOR  
 3 - SHAFT RETAINER

(5) Install the two bolts that secure the center instrument panel support bracket to the left side of the floor panel transmission tunnel.

(6) Connect the battery negative cable.

### INSTALLATION - HEAT/DEFROST DOOR VACUUM ACTUATOR

(1) Install the heat/defrost door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Engage the heat/defrost door pivot connection with the heat/defrost door pivot pin.

(3) Plug in the vacuum harness connector to the heat/defrost door vacuum actuator.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

### INSTALLATION - PANEL/DEFROST DOOR VACUUM ACTUATOR

(1) Install the panel/defrost door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Engage the panel/defrost door pivot connection with the panel/defrost door pivot pin.

(3) Plug in the vacuum harness connector to the heat/defrost door vacuum actuator.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## RECIRCULATION DOOR ACTUATOR

### DESCRIPTION

The recirculation door actuator for vehicles equipped with the standard equipment manual temperature control system is vacuum controlled. The optional Automatic Zone Control (AZC) system uses an electric recirculation door actuator. In the following procedures, service for both types of actuators is covered.

### REMOVAL

#### REMOVAL - RECIRCULATION DOOR VACUUM ACTUATOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

This actuator is used only on models equipped with the standard manual temperature control system.

(1) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.

(2) Unplug the vacuum harness connector from the recirculation door vacuum actuator.

(3) Disengage the recirculation door pivot connection from the door pivot pin.

(4) Disengage the recirculation door actuating rod from the recirculation door lever.

(5) Remove the screws that secure the recirculation door vacuum actuator to the HVAC housing.

(6) Remove the recirculation door vacuum actuator from the HVAC housing.

## RECIRCULATION DOOR ACTUATOR (Continued)

**REMOVAL - RECIRCULATION DOOR ELECTRIC ACTUATOR**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

This actuator is used only on models equipped with the optional Automatic Zone Control (AZC) system.

- (1) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.
- (2) Unplug the wire harness connector from the recirculation door actuator.

80b897cd

**Fig. 22 RECIRCULATION DOOR HOUSING**

- 1 - RECIRCULATION DOOR HOUSING  
2 - ATTACHING SCREWS

- (3) Remove the 2 screws securing the recirculation door housing to the HVAC unit (Fig. 22). Tilt the front of the housing up while reaching around the back releasing 2 tangs holding the rear of the housing down.

- (4) Remove the recirculation door housing from the HVAC unit.
- (5) Remove the screws that secure the recirculation door actuator to the HVAC housing.
- (6) Remove the recirculation door actuator from the HVAC housing.

**INSTALLATION****INSTALLATION - RECIRCULATION DOOR VACUUM ACTUATOR**

- (1) Install the recirculation door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Engage the recirculation door actuating rod with the recirculation door lever.
- (3) Engage the recirculation door pivot connection with the door pivot pin.
- (4) Plug in the vacuum harness connector to the recirculation door vacuum actuator.
- (5) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

**INSTALLATION - RECIRCULATION DOOR ELECTRIC ACTUATOR**

- (1) Install the recirculation door actuator on the recirculation door housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Install the recirculation door housing on the HVAC unit and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (3) Plug in the wire harness connector to the recirculation door actuator.
- (4) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

**VACUUM CHECK VALVE****DESCRIPTION**

Two vacuum check valves (non AZC only) are installed on the vacuum supply system. One is on the accessory vacuum supply line in the engine compartment, near the vacuum tap on the engine intake manifold. A second vacuum check valve is located on the bottom of the HVAC unit behind the passenger front floor duct on the black vacuum line. The vacuum check valves are designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

**OPERATION**

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected A/C Heater mode settings. The check valve will prevent

## VACUUM CHECK VALVE (Continued)

the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

(1) Unplug the HVAC vacuum supply line connector at the vacuum check valve near the engine intake manifold vacuum adapter fitting.

(2) Note the orientation of the check valve in the vacuum supply line for correct installation.

(3) Unplug the vacuum check valve from the vacuum supply line fittings.

### INSTALLATION

(1) Plug in the vacuum check valve at the vacuum supply line fittings, noting the orientation of the check valve in the vacuum supply line for correct installation.

(2) Plug in the HVAC vacuum supply line connector at the vacuum check valve near the engine intake manifold vacuum adapter fitting.

**Fig. 23 VACUUM RESERVOIR**

- 1 - FAN RELAY
- 2 - SPEED CONTROL SERVO
- 3 - VACUUM RESERVOIR

## VACUUM RESERVOIR

### DESCRIPTION

The vacuum reservoir is mounted in the right front of the vehicle behind the headlamp mounting module (Fig. 23). The headlamp mounting module and headlamp assembly must be removed from the vehicle to access the vacuum reservoir for service. Refer to Lamps/Lighting for the procedures.

### OPERATION

Engine vacuum is stored in the vacuum reservoir. The stored vacuum is used to operate the vacuum-controlled vehicle accessories during periods of low engine vacuum such as when the vehicle is climbing a steep grade, or under other high engine load operating conditions.

The vacuum reservoir cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

(1) Remove the right side headlamp mounting module and headlamp assembly. Refer to Lamps/Lighting for the procedures.

(2) Remove the two screws that secure the vacuum reservoir to the base of the radiator closure panel.

(3) Remove the vacuum reservoir.

### INSTALLATION

(1) Install the vacuum reservoir in the vehicle and tighten the two screws to 3.4 N·m (30 in. lbs.).

(2) Install the right side headlamp mounting module and headlamp assembly. Refer to Lamps/Lighting for the procedures.

## EVAPORATOR TEMPERATURE SENSOR

### DESCRIPTION

The evaporator probe is a 2 wire temperature sensing element located at the coldest point on the face of the evaporator. The switch is attached to the evaporator coil fins. The evaporator temperature probe prevents condensate water on the evaporator coil from freezing and obstructing A/C system air flow.

### OPERATION

The probe is used to switch the clutch OFF before evaporator freeze-up occurs. Output from the probe is sampled by the Body Control Module (BCM). The clutch is switched OFF when the probe temperature reaches 1.1° C (34° F). It is allowed to switch ON when the probe temperature reaches 2.2° C (36° F).

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

## EVAPORATOR TEMPERATURE SENSOR (Continued)

(2) Remove the HVAC housing from the vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(3) Disassemble the HVAC housing(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(4) Carefully pull the probe out of the evaporator core.

**INSTALLATION**

(1) Install the new probe into the evaporator.

**NOTE: The new probe must not go into the same hole (in the evaporator core) that the old probe was removed from.**

(2) Reassemble the HVAC housing(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).

(3) Reinstall the HVAC assembly in the vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

(4) Reconnect the battery negative cable.

## AIR OUTLETS

## REMOVAL

The driver side, and passenger side panel outlets are available for service. The center outlets are only serviced as part of the instrument cluster center bezel unit.

(1) Remove the instrument panel top pad from the instrument panel. Refer to Instrument Panel System for the procedures.

(2) Remove the two screws that secure each outlet to the backside of the instrument panel top pad (Fig. 1).

(3) Remove the outlet from the top pad.

## INSTALLATION

(1) Fasten the outlet to the top pad. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Install the instrument panel top pad on the instrument panel. Refer to Instrument Panel System for the procedures.

80ba7781

## BLOWER MOTOR

### DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box module. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

### OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the a/c heater mode control switch is in any position, except off. The blower motor circuit is protected by a fuse in the junction block. On models with the standard manual temperature control system, the blower motor speed is controlled by regulating the battery feed through the blower motor switch and the blower motor resistor. On models with the optional Automatic Zone Control (AZC) system, the blower motor speed is controlled by using Pulse Width Modulation (PWM). The blower motor controller adjusts the battery feed voltage to the blower motor, based upon an input from the blower motor switch, through the AZC control module. Pulse width modulation of blower power allows the blower to operate at any speed from stationary, to full speed.

The blower motor and blower motor wheel cannot be repaired, and if faulty or damaged, they must be replaced. The blower motor and blower wheel are each serviced separately.

### DIAGNOSIS AND TESTING - BLOWER MOTOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

For circuit descriptions and diagrams, refer to the appropriate wiring information. Possible causes of an inoperative blower motor include:

- Faulty fuse

- Faulty blower motor circuit wiring or wire harness connections
- Faulty blower motor resistor (if the vehicle is so equipped)
- Faulty blower motor controller (if the vehicle is so equipped)
- Faulty blower motor switch
- Faulty a/c heater mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor (if the vehicle is so equipped)
- Faulty blower motor controller (if the vehicle is so equipped)
- Faulty AZC module (if the vehicle is so equipped)
- Faulty blower motor circuit wiring or wire harness connections.

### VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or bent
- Blower motor faulty.

### NOISE

To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and operate the HVAC system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## BLOWER MOTOR (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Pinch the connector retainer and unplug the blower motor wire harness from the blower motor (Fig. 2).

**Fig. 2 BLOWER MOTOR (HOUSING REMOVED FROM VEHICLE)**

- 1 - BLOWER MOTOR RESISTOR
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP - (If Equipped)
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

(3) Remove the three screws that secure the blower motor and blower wheel assembly to the HVAC housing, using either a T-25 Torx® head or flat-bladed screwdriver.

(4) Lower the blower motor and wheel from the HVAC housing.

(5) Remove the blower wheel retainer clip (Fig. 3).

(6) Remove the wheel from the blower motor shaft.

## INSTALLATION

(1) Press the blower wheel hub onto the blower motor shaft. Be sure the flat on the blower motor shaft is indexed to the flat on the inside of the blower wheel hub.

(2) Install the retainer clip over the blower wheel hub.

(3) Install the blower motor in the HVAC housing with three mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(4) Plug the blower motor wire harness connector into the blower motor socket.

(5) Connect the battery negative cable.

## DEFROSTER DUCTS

## REMOVAL

(1) Remove the instrument panel assembly from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(2) Remove the three screws that secure the defroster duct to the HVAC unit housing (Fig. 4).

80ba7776

**Fig. 4 HVAC DEFROSTER DUCT**

- 1 - HVAC UNIT HOUSING
- 2 - INSTRUMENT PANEL
- 3 - SCREWS
- 4 - DEFROSTER DUCT

(3) Remove the defroster duct from the HVAC unit housing.

## DEFROSTER DUCTS (Continued)

## INSTALLATION

(1) Install the defroster duct on the HVAC unit housing.

(2) Install the three screws that secure the defroster duct to the HVAC unit housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Install the instrument panel assembly in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

## FLOOR DISTRIBUTION DUCTS

## REMOVAL

(1) To remove the driver side floor duct from the vehicle, remove the knee blocker panel for access to attaching screw. See Instrument Panel System for the procedures.

(2) The passenger side floor duct fastener can be accessed under the right-center instrument panel.

(3) Remove the screw that secures the floor duct(s) to the HVAC housing (Fig. 5).

## INSTALLATION

(1) Attach the floor duct(s) to the HVAC housing.

(2) Install the screw that secures the floor duct(s) to the HVAC housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Install the knee blocker panel. See Instrument Panel System for the procedures.

**Fig. 5 FLOOR DUCTS (HOUSING REMOVED)**

- 2 - HEAT/DEFROST DOOR SUB-ASSEMBLY
- 3 - DOOR LEVERS
- 4 - LOWER HOUSING
- 5 - FLOOR DUCTS
- 6 - LINKAGE
- 7 - RETAINING TABS

## INSTRUMENT PANEL DUCTS

## REMOVAL

(1) Remove the instrument panel top pad from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(2) Unsnap the duct extension(s) from the instrument panel structural duct assembly (Fig. 6).

**Fig. 6 INSTRUMENT PANEL STRUCTURAL DUCT ASSEMBLY**

- 1 - CENTER DUCT
- 2 - INSTRUMENT PANEL STRUCTURAL DUCT ASSEMBLY
- 3 - PANEL DUCT EXTENSIONS

## INSTRUMENT PANEL DUCTS (Continued)

(3) Remove the duct extension(s) from the instrument panel (Fig. 7).

**Fig. 7 INSTRUMENT PANEL DUCT EXTENSION**

- 1 - INSTRUMENT PANEL STRUCTURAL DUCT ASSEMBLY  
2 - PANEL DUCT EXTENSION

## INSTALLATION

(1) Connect the duct extension(s) to the instrument panel.

(2) Snap the duct extension(s) to the instrument panel structural duct assembly.

(3) Install the instrument panel top pad in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

## REAR FLOOR HEAT DUCT

## REMOVAL

(1) To remove the rear floor ducts from the vehicle, remove the knee blocker panels for access, and pull carpeting back.

(2) Pull the floor ducts from the HVAC housing (Fig. 8).

**NOTE:** The ductwork running from the HVAC housing rearward through the passenger compartment is molded into the carpeting, and must be replaced as a unit if damaged.

## INSTALLATION

- (1) Attach the floor ducts to the HVAC housing.
- (2) Install the knee blocker panels.
- (3) Install the carpeting back in its original position.

**Fig. 8 REAR FLOOR DUCTS**

- 1 - LEFT REAR PASSENGER FLOOR AIR DUCT  
2 - RIGHT REAR PASSENGER FLOOR AIR DUCT  
3 - TO CARPET DUCT  
4 - TO CARPET DUCT

## HVAC HOUSING

## REMOVAL

The HVAC housing assembly must be removed from the vehicle and the two halves of the housing separated for service access of the heater core, evaporator coil, blend door(s), and each of the various mode doors.

**WARNING:** ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

**WARNING:** REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

- (1) Disconnect and isolate the battery negative cable.

## HVAC HOUSING (Continued)

(2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(4) Disconnect the liquid line refrigerant line from the evaporator inlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL). Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Disconnect the suction line refrigerant line from the evaporator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/SUCTION LINE - REMOVAL), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/SUCTION LINE - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/SUCTION LINE - REMOVAL). Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Disconnect the heater hoses from the heater core tubes. Clamp off the heater hoses to prevent loss of coolant. Refer to Cooling for the procedures. Install plugs in, or tape over the opened heater core tubes.

(7) Remove the bolt from the HVAC housing mounting stud on the engine compartment side of the dash panel (Fig. 9).

**Fig. 9 HVAC Housing - (rear view)**

- 1 - Instrument Panel
- 2 - Air Intake
- 3 - Expansion Valve
- 4 - HVAC Housing

(10) Remove the HVAC housing from the vehicle, ensuring that the interior is covered in case of loss of fluids.

## HVAC HOUSING (Continued)

**DISASSEMBLY**

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Place the HVAC housing with the tubing side down on a work bench, making allowance for leakage of fluids.

(3) Using a sharp knife, split the foam seal surrounding the panel outlet opening, at the dividing line of the upper and lower cases (Fig. 12).

80b897ca

**Fig. 12 SPLIT FOAM SEAL AT PANEL OUTLET**

- 1 - ONE PIECE FOAM SEAL
- 2 - FLOOR DUCT
- 3 - TO REAR PASSENGER FLOOR AIR DUCT

(4) Place the HVAC housing in the upright position on the work bench.

(5) Remove the mode door actuator on the left side of the housing, which controls the mode door in the top of the case (Fig. 13) (Fig. 14).

80b897c5

**Fig. 13 MODE DOOR ACTUATORS - MANUAL SYSTEM**

5 - HEATER CORE TUBES

(9) Remove the 10 screws that secure the two housing halves to each other.

(10) Separate the top half of the HVAC housing from the bottom half (Fig. 18).

**NOTE:** The blend door sub-assembly is attached to the housing with 2 screws, and may be removed for service (Fig. 19).

## ASSEMBLY

(1) Place the top half of the HVAC housing on the bottom half. Be certain that each of the door pivot pins align with the pivot holes in the HVAC housing.

(2) Install the 10 screws that secure the two housing halves to each other. Tighten the HVAC housing screws to 2.2 N·m (20 in. lbs.).

(3) Attach the wire harness electrical connector(s) to the mounts on the lower case at the blower motor end of the unit.

(4) Install the 5 clips that secure the two housing halves to each other. Check doors for binding after replacement, and after assembly of housing.

(5) Install the screw with plastic washer holding the lever assembly to the upper case section.

(6) Install the mode door actuator on the left side of the housing.

**INSTALLATION**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once

## HVAC HOUSING (Continued)

a year to make sure they are in good condition and properly routed.

(1) Position the HVAC housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install the HVAC housing mounting nuts to the studs on the passenger compartment side of the dash panel. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(3) Connect the HVAC housing wire harness connectors.

(4) Reinstall the rear floor heat ducts to the center floor heat duct outlets.

(5) Install and tighten the bolt onto the HVAC housing mounting stud on the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (60 in. lbs.).

(6) Unclamp/unplug the heater core hoses and tubes. Connect the heater hoses to the heater core tubes and fill the engine cooling system. Refer to Cooling for the procedures.

(7) Unplug or remove the tape from the suction line and the evaporator outlet tube fittings. Connect the suction line to the evaporator outlet tube. Tighten retaining nut to 28 N·m (250 in. lbs.).

(8) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line to the evaporator inlet tube. Tighten retaining nut to 28 N·m (250 in. lbs.).

(9) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(10) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(11) Install the instrument panel in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(12) Connect the battery negative cable.

(13) Start the engine and check for proper operation of the heating and air conditioning systems.

## BLEND DOOR

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PER-**

**FORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Remove evaporator from lower case to ease access to plastic door shaft bushing.

(3) Pinch the retention tabs holding the blend door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer.

(4) Remove door(s).

## INSTALLATION

(1) Install the blend door(s) by snapping the pivot shaft into the HVAC case.

(2) Install the evaporator in the lower case.

(3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

**NOTE: The blend door sub-assembly is attached to the housing with 2 screws, and may be removed for service (Fig. 20).**

## MODE DOOR (Continued)

## REMOVAL - PANEL/DEFROST DOOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Remove and disassemble the HVAC housing. See HVAC Housing in this group for the procedures.
- (2) Pinch the retention tabs holding the panel/defrost door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer (Fig. 25).

**Fig. 25 PANEL/DEFROST DOOR**

- 1 - UPPER HOUSING
- 2 - LEVER
- 3 - PANEL/DEFROST MODE DOOR

- (3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel/defrost door pivot shaft retainer from the pivot shaft.

- (4) Remove the panel/defrost door from the HVAC housing.

## INSTALLATION

## INSTALLATION - PANEL OUTLET DOOR

- (1) Snap the panel outlet door pivot shaft retainer on the pivot shaft.
- (2) Attach the panel outlet door pivot shaft to the HVAC case.
- (3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## INSTALLATION - HEAT/DEFROST DOOR

- (1) Install the heat/defrost door by snapping the heat/defrost door pivot shaft into the HVAC case.
- (2) Install the heat/defrost door sub-assembly and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (3) Attach the metal linkage to the heat/defrost door lever.
- (4) Snap the duct adapter to the bottom of the heat/defrost door sub-assembly.
- (5) Install the 2 floor heat ducts and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (6) Install the evaporator, and styrofoam tray in the lower case.
- (7) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## INSTALLATION - PANEL/DEFROST DOOR

- (1) Snap the panel/defrost door pivot shaft retainer on the pivot shaft.
- (2) Attach the panel/defrost door pivot shaft to the HVAC case.
- (3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## RECIRCULATION DOOR

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)
- (2) Place the HVAC housing right side up on the work bench.
- (3) Unplug the wire/vacuum connector from the recirculation door actuator.
- (4) Remove the 2 screws fastening the recirculation door sub-assembly to the main housing (Fig. 26).

80b897cd

**Fig. 26 RECIRCULATION DOOR HOUSING**

- 1 - RECIRCULATION DOOR HOUSING  
2 - ATTACHING SCREWS

(5) Raise the front of the door sub-assembly while releasing the 2 tabs holding the rear to the main housing, and remove the recirculation door housing.

(6) Remove the electric/vacuum actuator from the recirculation door sub-assembly and set aside.

(7) Pinch the retention tabs holding the recirculation door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer.

(8) Remove the recirculation door from the recirculation air door housing.

### INSTALLATION

(1) Install the recirculation door in the recirculation air door housing by snapping the pivot shaft retention tabs into the case.

(2) Install the electric/vacuum actuator on the recirculation door sub-assembly. Check door for binding after replacement.

(3) Install the recirculation door housing on the HVAC case and tighten the 2 screws to 2.2 N-m (20 in. lbs.).

(4) Plug in the wire/vacuum connector to the recirculation door actuator.

(5) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## PLUMBING

### DESCRIPTION - REFRIGERANT LINE

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

### OPERATION - REFRIGERANT LINE

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

## WARNING

**WARNING: THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.**

**AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.**

**DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.**

**IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION. THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.**

**THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.**

## PLUMBING (Continued)

## CAUTION

## CAUTION

**CAUTION:** Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.

Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.

Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

The refrigerant system must always be evacuated before charging.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.

Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.

Do not remove the sealing caps from a replacement component until it is to be installed.

When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.

Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.

When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

## REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.

- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system

## PLUMBING (Continued)

ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

## DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

An electronic leak detector designed for R-134a refrigerant is recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system, perform one of the following procedures:

### SYSTEM EMPTY

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detec-

tor probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(5) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, the A/C button in the On position, and select the Recirculation Mode.

### SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, the A/C button in the On position, and select the Recirculation Mode.

## STANDARD PROCEDURE

### STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

**WARNING: EYE PROTECTION MUST BE WORN WHEN SERVICING AN AIR CONDITIONING REFRIGERANT SYSTEM. TURN OFF (ROTATE CLOCKWISE) ALL VALVES ON THE EQUIPMENT BEING USED, BEFORE CONNECTING TO OR DISCONNECTING FROM THE REFRIGERANT SYSTEM. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY.**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the

## PLUMBING (Continued)

equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 1). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

**Fig. 1 MANIFOLD GAUGE SET - TYPICAL**

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

## MANIFOLD GAUGE SET CONNECTIONS

**CAUTION:** Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

**LOW PRESSURE GAUGE HOSE** The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line near the dash panel.

**HIGH PRESSURE GAUGE HOSE** The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

**RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE** The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacu-

ate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

## STANDARD PROCEDURE - REFRIGERANT RECOVERY

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION.** (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

## STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION.** (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

(1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.

(2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. (Refer to 24 - HEATING & AIR CON-

## PLUMBING (Continued)

**CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS)**

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

**STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

**PARTIAL CHARGE METHOD**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

The partial charge method is used to add a partial charge to a refrigerant system that is low on refrigerant. To perform this procedure the evaporator inlet and outlet tube temperatures are measured. The temperature difference is measured with a temperature meter with one or two clamp-on thermocouple probes. The difference between the evaporator inlet and outlet tube temperatures will determine the amount of refrigerant needed.

Before adding a partial refrigerant charge, check for refrigerant system leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS

AND TESTING - REFRIGERANT SYSTEM LEAKS) If a leak is found, make the necessary repairs before attempting a full or partial refrigerant charge.

(1) Attach a manifold gauge set to the refrigerant system service ports.

(2) Attach the two clamp-on thermocouple probes to the inlet and outlet tubes of the evaporator coil.

- If a single thermocouple probe is used, attach the probe to the evaporator inlet tube just before the collar of the refrigerant line connector fitting. The probe must make contact with the bottom surface of the evaporator inlet tube.

- If dual thermocouple probes are used, attach probe 1 to the evaporator inlet tube, and probe 2 to the evaporator outlet tube. Attach both probes to the evaporator tubes just before the collar of the refrigerant line connector fittings. The probes must make contact with the bottom surfaces of the evaporator inlet and outlet tubes.

(3) Open all of the windows or doors of the passenger compartment.

(4) Set the A/C button on the A/C Heater controls to the on position, the temperature control knob in the full cool position, select Recirculation Mode, and place the blower motor switch in the highest speed position.

(5) Start the engine and hold the engine idle speed at 1,000 rpm. Allow the engine to warm up to normal operating temperature.

(6) The compressor clutch may cycle, depending upon ambient temperature, humidity, and the refrigerant system charge level.

(7) Hold the engine idle speed at 1,000 rpm.

(8) Allow three to five minutes for the refrigerant system to stabilize, then record the temperatures of the evaporator inlet and outlet tubes.

- If a single probe is used, record the temperature of the evaporator inlet tube. Then remove the probe from the inlet tube and attach it to the evaporator outlet tube just before the collar of the refrigerant line connector fitting. The probe must make contact with the bottom surface of the evaporator outlet tube. Allow the thermocouple and meter time to stabilize, then record the temperature of the evaporator outlet tube. Subtract the inlet tube temperature reading from the outlet tube temperature reading.

- If dual probes are used, record the temperatures of both the evaporator inlet and outlet tubes. Then subtract the inlet tube temperature reading from the outlet tube temperature reading.

(9) If the measured temperature differential is higher than 22° C to 26° C (40° F to 47° F), add 0.4 kilograms (14 ounces) of refrigerant.

(10) Allow three to five minutes for the refrigerant system to stabilize, then take a second set of thermo-

## PLUMBING (Continued)

couple measurements. Record the temperature difference to determine if an additional charge is required.

(11) Record the compressor discharge pressure. If the reading is higher than the pressure shown in the

Compressor Discharge Pressure Chart, the system could be overcharged. If the reading is equal to, or lower, than the pressure shown in the chart, continue with this procedure.

Compressor Discharge Pressure Chart						
Ambient Temperature	16°C (60°F)	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Compressor Discharge Pressure	1378 kPa (200 psi)	1516 kPa (220 psi)	1723 kPa (250psi)	1930 kPa (280 psi)	2206 kPa (320 psi)	2413 kPa (350 psi)

(12) **EXAMPLE:** The ambient temperature is 21° C (70° F). The evaporator inlet tube temperature is 12° C (54° F) and the evaporator outlet tube temperature is 10° C (50° F). Subtract the inlet tube temperature from the outlet tube temperature. The difference is -2° C (-4° F). With a -2° C (-4° F) temperature differential at 21° C (70° F) ambient temperature, the system is fully charged.

(13) Add enough refrigerant to bring the refrigerant system up to a full charge.

caused by condenser air flow restriction or an overcharge of refrigerant.

## OPERATION

### OPERATION - A/C COMPRESSOR

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley, and coil, are available for service.

### OPERATION - HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

## SPECIFICATIONS

### CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle is 0.765 kilograms (1.687 pounds/27 ounces).

## A/C COMPRESSOR

### DESCRIPTION

#### DESCRIPTION - A/C COMPRESSOR

The air conditioning system uses a Nippondenso 10PA17 ten cylinder, double-acting swash plate-type compressor on all models. This compressor has a fixed displacement of 170 cubic centimeters (10.374 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

#### DESCRIPTION - HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor manifold, which is on the side of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components,

## A/C COMPRESSOR (Continued)

**DIAGNOSIS AND TESTING - COMPRESSOR NOISE**

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Cooling before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION)

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

(5) If the noise is from opening and closing of the high pressure relief valve, reclaim, evacuate, and recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) If the high pressure relief valve still does not seat properly, replace the a/c compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL)

(6) If the noise is from liquid slugging on the suction line, check the refrigerant oil level and the refrigerant system charge. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY).

(7) If the noise continues, replace the compressor and repeat Step 1.

**REMOVAL****REMOVAL**

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt. Refer to Cooling for the procedures.

**NOTE: With the 4.0L engine it is necessary to remove the following two additional items.**

(4) Remove the air cleaner assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(5) Remove and set aside the power steering pump. It is not necessary to disconnect the lines or remove the pump from the vehicle.

(6) Unplug the compressor clutch coil wire harness connector.

## A/C COMPRESSOR (Continued)

(7) Remove the (2) refrigerant line retaining bolts that secure the suction line and discharge line to the compressor. Install plugs in, or tape over all of the opened refrigerant fittings.

(8) Remove the bolts that secure the compressor (Fig. 2) or (Fig. 3) and (Fig. 4).

**INSTALLATION****INSTALLATION**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should

be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

**NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)**

(1) Install the compressor. Tighten the 4.0L mounting bolts fastening the compressor to the block to 45-65 N·m (35-50 ft. lbs.). Tighten the mounting bolts holding the rear brace to the compressor and block to 40-55 N·m (30-40 ft. lbs.). Tighten the 4.7L

## A/C COMPRESSOR (Continued)

compressor front mounting screws to 45-65 N·m (35-50 ft. lbs.), and the rear mounting screws to 35-45 N·m (25-35 ft. lbs.).

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction line and discharge line fittings to the manifold on the compressor. Tighten the mounting bolts to 25.4 N·m (225 in. lbs.).

(3) Install the serpentine drive belt. Refer to Cooling for the procedures.

(4) Plug in the compressor clutch coil wire harness connector.

**NOTE:** With the 4.0L Engine it is necessary to install the following two additional items.

(5) Install the power steering pump(Refer to 19 - STEERING/PUMP - INSTALLATION).

(6) Install the air cleaner assembly(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(7) Connect the battery negative cable.

(8) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(9) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

## INSTALLATION - 2.7L TURBO DIESEL

**CAUTION:** Check the oil level before installing the new compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE)

**WARNING:** REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operat-

ing. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Lift the compressor into position and install the (4) mounting bolts. Torque the bolts to 41 N·m (30 ft. lbs.).

(2) Connect the compressor clutch electrical connector.

(3) Install both refrigerant lines on the compressor. Make certain the sealing O-rings are free of tears and well lubricated with R-134a refrigerant oil. Torque the line retaining bolts to 22 N·m (200 in. lbs.).

(4) Install the front splash shield (if equipped).

(5) Lower the vehicle from the hoist.

(6) Install the accessory drive belt on the compressor clutch. Refer to Cooling for the procedure.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(9) Connect the negative battery cable.

## A/C CONDENSER

## DESCRIPTION

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins.

## OPERATION

When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

## A/C CONDENSER (Continued)

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.**

**CAUTION:** Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the screws attaching the grille and headlamp mounting module to the upper crossmember of the vehicle. Refer to Body for this and further steps in the procedure.

(4) Remove the headlamps from their mounts.

(5) Remove the nuts that secure the hood latch and brace to the upper crossmember.

(6) The radiator upper crossmember can be adjusted left or right through the use of its slotted mounting holes. Before removal, mark the original position of the crossmember.

(7) Remove the bolts that secure the radiator to the upper crossmember and set it aside (Fig. 6).

(8) Remove the engine air filter inlet duct secured at the headlamp mounting module.

(9) Remove the headlamp mounting module and front fascia for access to the condenser and fittings.

(10) Disconnect the discharge line and liquid line refrigerant line fittings from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(11) Remove the bolts that secure the upper condenser and transmission cooler.

(12) Carefully lift the condenser out of the vehicle.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

## A/C CONDENSER (Continued)

**CAUTION:** Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

- (1) Carefully position the condenser in the vehicle.
- (2) Install the bolts that secure the upper condenser and transmission cooler.
- (3) Remove the tape or plugs from the refrigerant line fittings on the condenser inlet and the discharge line. Connect the discharge line to the condenser inlet. Tighten the retaining nut to 28 N·m (250 in. lbs.).
- (4) Remove the tape or plugs from the refrigerant line fittings on the condenser outlet and the liquid line. Connect the liquid line to the condenser outlet. Tighten the retaining nut to 28 N·m (250 in. lbs.).
- (5) Install the headlamp mounting module and grill. Refer to Body for the procedure.
- (6) Install the engine air filter inlet duct.
- (7) Install the bolts that secure the radiator to the upper crossmember.
- (8) Install the nuts that secure the hood latch and brace to the upper crossmember.
- (9) Install the headlamps in their mounts.
- (10) Install the screws attaching the grille and headlamp mounting module to the upper crossmember of the vehicle. Refer to Body for this and further steps in the procedure.
- (11) Evacuate and Recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)
- (12) Connect the battery negative cable.

**NOTE:** If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

## A/C DISCHARGE LINE

## REMOVAL

## REMOVAL - 2.7L TURBO DIESEL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

- (1) Disconnect and isolate the negative battery cable.
- (2) Recover the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (3) Remove the a/c high pressure transducer (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - REMOVAL).
- (4) Remove the grill assembly (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL) (Fig. 7).

- 5 - A/C COMPRESSOR
- 6 - DISCHARGE LINE & CONDENSOR CONNECTION

(5) Remove the refrigerant line retaining fastener from the condenser inlet fitting. Remove the line and cap the condenser inlet tube to prevent contamination of the system.

- (6) Raise the vehicle on a hoist.
- (7) Remove the front splash shield (if equipped).

## A/C DISCHARGE LINE (Continued)

(8) Remove the refrigerant line retaining fastener from the compressor outlet fitting. Remove the line and cap the compressor outlet opening to prevent contamination of the system.

(9) Unclip and remove the discharge line from the vehicle.

**REMOVAL**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.**

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the a/c high pressure transducer (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - REMOVAL).

(4) Remove the grill assembly (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(5) Disconnect the discharge line from the condenser inlet. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the bolt that secures the discharge line fitting to compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Remove the discharge line assembly from the vehicle.

**INSTALLATION****INSTALLATION - 2.7L TURBO DIESEL**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the

flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Carefully position the discharge line in the vehicle.

(2) Remove the cap and install the discharge line on the compressor. Be certain the sealing o-ring is well lubricated with PAG oil and free of tears. Torque the retaining fastener to 22 N·m (200 in. lbs.).

(3) Install the front splash shield (if equipped).

(4) Lower the vehicle from the hoist.

(5) Remove the cap and install the discharge line on the condenser. Be certain the sealing o-ring is well lubricated with PAG oil and free of tears. Torque the retaining fastener to 28 N·m (21 ft. lbs.).

(6) Install the grill assembly (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

(7) Install the a/c high pressure transducer, and connect the electrical connector (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - INSTALLATION).

(8) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(9) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(10) Connect the negative battery cable.

**INSTALLATION**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

## A/C EXPANSION VALVE

## DESCRIPTION

The "H" valve type thermal expansion valve (TXV) is located at the front of the heater-A/C housing between the liquid and suction lines and the evaporator coil.

The expansion valve is a factory calibrated unit and cannot be adjusted or repaired. If faulty or damaged, the expansion valve must be replaced.

## OPERATION

High-pressure, high temperature liquid refrigerant from the liquid line passes through the expansion valve orifice, converting it into a low-pressure, low-temperature mixture of liquid and gas before it enters the evaporator coil. A temperature sensor in the expansion valve control head monitors the tem-

perature of the refrigerant leaving the evaporator coil through the suction line, and adjusts the orifice size at the liquid line to let the proper amount of refrigerant into the evaporator coil to meet the vehicle cooling requirements. Controlling the refrigerant flow through the evaporator ensures that none of the refrigerant leaving the evaporator is still in a liquid state, which could damage the compressor.

## DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

The expansion valve is located on the engine side of the dash panel near the shock tower.

The expansion valve can fail in three different positions (open, closed or restricted).

**In an Open Position:** this will result in a noisy compressor or no cooling. The cause can be broken spring, broken ball or excessive moisture in the A/C system. If the spring or ball are found to be defective, replace the expansion valve. If excessive moisture is found in the A/C system, recycle the refrigerant.

**In a Closed Position:** There will be low suction pressure and no cooling. This may be caused by a failed power dome or excessive moisture in the A/C system. If the power dome on the expansion valve is found to be defective replace the expansion valve. If excessive moisture is found recycle the refrigerant.

**A Restricted Orifice:** There will be low suction pressure and no cooling. This may be caused by debris in the refrigerant system. If debris is believed to be the cause, recycle the refrigerant and replace the expansion valve and the receiver/drier.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(3) Disconnect the the A/C lines from the expansion valve. Cap or tape over the open A/C lines.

(4) Remove the lines from the expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C DISCHARGE LINE - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C DISCHARGE LINE - REMOVAL).

(5) Remove the expansion valve retainer screw from the expansion valve.

(6) Remove the expansion valve.

(7) Remove the expansion valve gasket.

## A/C EXPANSION VALVE (Continued)

**INSTALLATION**

- (1) Install a NEW gasket and install the expansion valve to the evaporator.
- (2) Install the expansion valve bolts and tighten to 11 N·m (100 in. lbs.).
- (3) Install NEW seals on the A/C lines and install the lines to the expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C DISCHARGE LINE - INSTALLATION), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C DISCHARGE LINE - INSTALLATION), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - INSTALLATION).
- (4) Evacuate the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (5) Recharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (6) Connect the battery negative cable.

(4) Remove the cap or tape and install the suction line on the thermal expansion valve body. Be certain the sealing O-ring is well lubricated with PAG oil and free of tears. Torque the retaining fastener to 28 N·m (21 ft. lbs.).

(5) Install the tie-straps retaining the wire harness on the suction line.

## SUCTION LINE (Continued)

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(8) Connect the negative battery cable.

## A/C EVAPORATOR

## DESCRIPTION

The evaporator coil is located in the HVAC housing, under the instrument panel. The evaporator coil is positioned in the HVAC housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator coil tubes.

## OPERATION

Refrigerant enters the evaporator from the thermal expansion valve as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas before it leaves the evaporator.

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Lift the evaporator coil unit out of the lower half of the HVAC housing (Fig. 11).

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Install the evaporator coil in the bottom half of the HVAC housing. Be certain that the evaporator foam insulator wrap is reinstalled.

(2) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

**NOTE:** If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Cooling for more information on the engine cooling system, the engine coolant and the heater hoses.

## HEATER CORE

### DESCRIPTION

The heater core is located in the HVAC housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins.

### OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The temperature control door allows control of the heater output air temperature by controlling how much of the air flowing through the HVAC housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

### REMOVAL

**WARNING:** ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

## HEATER CORE (Continued)

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) When installing individual tubes, insert tube into core ensuring that tube O-ring is seated in core and not pinched. Hold tube in seated position while installing the round tube-to-core clamp (Fig. 14).

**Fig. 14 HEATER CORE, TUBES, AND O-RINGS**

- 1 - HEATER CORE TUBES
- 2 - TUBE-TO-CORE CLAMPS
- 3 - SCREWS
- 4 - O-RINGS
- 5 - HEATER CORE

**NOTE: The round tube-to-heater-core clamp should be left loose enough to turn the tube in the core. Position the core in the housing, and then tighten the tube-to-heater-core clamp after orienting the tubes to the molded HVAC housing.**

(2) Lower the heater core into the HVAC housing.  
(3) Install the mode door actuator, if removed from housing for core removal.

(4) Position the retainers over the heater core tubes. Install and tighten the screws that secure the heater core and retainers to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

**NOTE: The grounding strap is to be attached to the lower heater core tube retainer. (If Equipped)**

(5) Reinstall the HVAC housing to the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## RECEIVER / DRIER

## DESCRIPTION

The receiver/drier is mounted in the engine compartment between the condenser and is part of the liquid line assembly. The filter/drier cannot be repaired, if the filter/drier is faulty, damaged, left open to the atmosphere or contaminated the line assembly must be replaced.

## OPERATION

The filter-drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the expansion valve. A desiccant bag is mounted inside the filter-drier canister to absorb any moisture which may have nettered and become trapped within the refrigerant system. In addition, during periods of high demand air conditioner operation, the filter-drier acts as a reservoir to store surplus refrigerant. Refrigerant enters the filter-drier as a high-pressure, low-temperature liquid.

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

## RECEIVER / DRIER (Continued)

(2) Remove the battery and the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(3) Remove the grill assembly (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(4) Remove the screw from the receiver/drier bracket (Fig. 15) or (Fig. 16).

(5) Remove the retaining nut from the evaporator connection and then slide the suction line off the stud and liquid line.

(6) Remove the receiver/drier bracket from the stud and disconnect the liquid line from the evaporator inlet. Install plugs in or tape over all of the evaporator connection openings and opened refrigerant line fittings.

(7) Disconnect the liquid line from the condenser outlet. Install plugs in, or tape over all of the opened refrigerant line fittings.

(8) Remove liquid line assembly.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Remove the tape or plugs from the refrigerant line fittings on the condenser outlet and the condenser end of the liquid line. Connect the liquid line to the condenser outlet. Tighten the retaining nut to 20.16 N·m (180 in. lbs.).

(2) Remove the tape or plugs from the refrigerant line fittings on the evaporator end of the liquid line and the evaporator inlet. Place the receiver/drier bracket on the stud and connect the liquid line to the evaporator inlet.

(3) Remove the tape or plugs from the suction line and evaporator outlet. Slide the suction line connection block on the liquid line on the evaporator connection stud. Tighten the retaining nut to 20.16 N·m (180 in. lbs.).

(4) Insert a screw for the receiver/drier bracket and hand turn three turns. Tighten the screw to 10.64 N·m (95 in. lbs.).

(5) Install the grill assembly (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

(6) Install the battery tray and the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

**NOTE: If the receiver/drier is replaced, add 120 milliliters (4 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)**

## REFRIGERANT

## DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

## OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

## REFRIGERANT OIL

### DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkyene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The 10PA17 compressor used in this vehicle is designed to use an ND8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

### OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

### STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

Refrigerant Oil Capacities		
Component	ml	fl oz
A/C System	130	4.40
Receiver Drier	70	2.37
Condenser	10	0.34
Evaporator	50	1.69
Compressor	drain and measure the oil from the old compressor - see text.

## VISCOUS HEATER

### OPERATION - VISCOUS HEATER

The Viscous Heater is driven by the engine fan belt. The Viscous Heater has an electro-mechanical clutch that receives a signal from the HVAC control head and the Viscous Heater controller that energizes and engages the clutch. Once engaged the clutch allows the Viscous Heater to increase the temperature of the coolant flowing to the heater core, which provides heat to the passenger compartment quicker than normal engines without the Viscous Heater. The Viscous Heater generates heat by means of friction which heats a special Silicon Oil within its housing which is then transferred to the engine coolant when the coolant passes over fins within the pump. Please note that the coolant is isolated from the silicon oil within the pump housing. When demand for passenger compartment heat decreases the Viscous Heater clutch will receive an input from the Viscous heater controller to disengage.

### REMOVAL - VISCOUS HEATER

- (1) Drain the engine coolant(Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
- (2) Remove the engine accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (3) Remove the heater hose clamps at the Viscous Heater.
- (4) Remove the heater hoses from the Viscous Heater.
- (5) Unplug the Viscous Heater clutch electrical connector.
- (6) Remove the bolts holding the Viscous Heater to the mounting bracket.
- (7) Remove the Viscous Heater from the vehicle.

### INSTALLATION

- (1) Install Viscous Heater to engine mounting bracket.

- (2) Install the Viscous Heater mounting bolts and tighten to 33 N·m ( 25 ft. lbs.).
- (3) Plug the wiring harness electrical connector to the Viscous Heater clutch.
- (4) Install heater hoses to the Viscous Heater connections.
- (5) Install heater hose clamps to Viscous Heater connections.
- (6) Install the engine accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (7) Refill the engine cooling system(Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
- (8) Reconnect the battery negative cable.
- (9) Operate vehicle and check for any coolant leaks, repair as required.

## VISCOUS HEATER CLUTCH

### DESCRIPTION - VISCOUS HEATER CLUTCH

The basic viscous heater clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly and a clutch plate. The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings (Fig. 1). The clutch plate is keyed to the viscous heater shaft and secured with a nut. These components provide the means to engage and disengage the viscous heater from the engine accessory drive belt.

### OPERATION - VISCOUS HEATER CLUTCH

When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the viscous heater shaft. When the coil is not energized the pulley freewheels on the clutch hub bearing, which is part of the pulley. The viscous heater clutch and coil are the only serviced parts on the viscous heater assembly. If the viscous heater is inoperative or damaged the entire assembly must be replaced. The viscous heater clutch engagement is

## VISCOUS HEATER CLUTCH (Continued)

controlled by several components: the viscous heater controller, the engine powertrain control module and the HVAC control head.

## REMOVAL - VISCOUS HEATER CLUTCH

(1) The viscous heater clutch can be serviced in the vehicle and the cooling system does not have to be drained.

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Unplug the clutch coil wire harness connector.

(5) Remove the bolts that secure the viscous heater to the mounting bracket.

(6) Remove the viscous heater from the mounting bracket. Support the viscous heater in the engine compartment while servicing the clutch.

(7) Insert the two pins of the spanner wrench (special Tool C-4489 or equivalent) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 2).

(8) Remove the clutch plate.

(9) Remove the clutch shims.

(10) Remove the external front housing snap ring with snap ring pliers (Fig. 3).

(11) Install the lip of the rotor puller (Special Tool C-6141-1 or equivalent) into the snap ring groove exposed in the previous step, and install the shaft protector (Special Tool C-6141-2 or equivalent) (Fig. 4).

(12) Install the puller through bolts (Special Tool C-6461 or equivalent) through the puller flange and into the jaws of the rotor puller and tighten. Turn the puller center bolt clockwise until the rotor is free (Fig. 5).

**Fig. 2 CLUTCH NUT REMOVE-typical**

- 1 - CLUTCH PLATE
- 2 - SPANNER

**Fig. 3 EXTERNAL SNAP RING REMOVE- typical**

- 1 - PULLEY
- 2 - SNAP RING PLIERS

(13) Remove the screw and retainer from the clutch coil lead wire harness on the viscous heater housing.

(14) Remove the snap ring from the hub and remove the clutch field coil (Fig. 6). Slide the clutch field coil off of the hub.

## INSTALLATION - VISCOUS HEATER CLUTCH

(1) Install the clutch field coil and snap ring.

(2) Install the screw and retainer on the clutch coil lead wire harness on the viscous heater housing. Tighten the screw to 2.2 N·m (20 in. lbs.).

(3) Align the rotor assembly squarely on the front housing hub.

(4) Install the rotor bearing assembly with the installer (Special Tool C-6871 or equivalent). Thread

## VISCOUS HEATER CLUTCH (Continued)

**Fig. 4 SHAFT PROTECTOR AND PULLER- typical**

- 1 - PULLER JAW  
2 - SHAFT PROTECTOR

**Fig. 5 INSTALL PULLER PLATE- typical**

- 1 - PULLER JAW  
2 - PULLER

the installer on the shaft, then turn the nut until the rotor assembly is seated.

(5) Install the external front housing snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

**CAUTION:** If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(6) Install the original clutch shims on the shaft.

(7) Install the clutch plate. Install the shaft hex nut and tighten to 15–20 N·m (11–15 ft. lbs.).

(8) Check the clutch air gap with a feeler gauge (Fig. 7). If the gap does not meet specification, add or

**Fig. 6 CLUTCH FIELD COIL SNAP RING REMOVE- typical**

- 1 - COIL  
2 - SNAP RING PLIERS

**Fig. 7 CHECK CLUTCH AIR GAP- typical**

- 1 - FEELER GAUGE

subtract shims as required. The air gap specification is 0.41 to 0.79 millimeters (0.016 to 0.031 inches).

**NOTE:** The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch (and not having the old shims available) use a 1.0, 0.50 and 0.13 millimeter (0.040, 0.020 and 0.005 inch) shim from the new clutch hardware package that is provided with the new clutch.

(9) Reinstall the viscous heater to the mounting bracket. Tighten the mounting screws to 33 N·m (25 ft. lbs.).

(10) Reinstall the battery negative cable.

## EMISSIONS CONTROL 4.0L/4.7L

### DESCRIPTION

#### DESCRIPTION - EMISSION CONTROL SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator (check engine) Lamp. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 1).

**NOTE:** Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all DTC's and extinguish the MIL (check engine lamp).

#### DESCRIPTION - STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

#### DESCRIPTION - CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

80b898f4

**Fig. 1 Data Link (Diagnostic) Connector Location**

- 1 - INSTRUMENT PANEL LOWER/LEFT EDGE  
2 - DATA LINK CONNECTOR

the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

## DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

**Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

### BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

### OBTAINING DTC'S USING DRB SCAN TOOL

- (1) Obtain the applicable Powertrain Diagnostic Manual.
- (2) Obtain the DRB Scan Tool.
- (3) Connect the DRB Scan Tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(4) Turn the ignition switch on and access the "Read Fault" screen.

(5) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(6) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

## DESCRIPTION - TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is referred to as the "Task Manager".

## DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

**Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.**

The following is an operation and description of each system monitor:

## OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely propor-

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

tional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

### OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

### LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

**Pump Mode:** The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

**Test Mode:** The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" water. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the O<sub>2</sub> control system. If fuel vapor, indicated by a shift in the O<sub>2</sub> control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

### MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

### FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O<sub>2</sub>S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O<sub>2</sub>S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

### CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O<sub>2</sub>S's) to monitor the efficiency of the converter. The dual O<sub>2</sub>S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O<sub>2</sub>S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O<sub>2</sub>S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O<sub>2</sub>S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O<sub>2</sub>S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O<sub>2</sub>S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O<sub>2</sub>S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O<sub>2</sub>S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O<sub>2</sub>S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

### DESCRIPTION - TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunc-

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

tion Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

## DESCRIPTION - COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a

DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks or any component that has an associated limp in will set a fault after 1 trip with the malfunction present. Components without an associated limp in will take two trips to illuminate the MIL.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

## DESCRIPTION - NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

### FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

### SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

### CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

### EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

### FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

## EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

## THROTTLE BODY AIRFLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

## VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

## PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The mod-

ule should be mounted to the body at all times, also during diagnostic.

## PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

## DESCRIPTION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

## DESCRIPTION - LOAD VALUE

ENGINE	IDLE/NEUTRAL	2500 RPM/NEUTRAL
All Engines	2% to 8% of Maximum Load	9% to 17% of Maximum Load

## OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

## Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there

are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

### MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

### Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

#### Priorities

- Priority 0 — Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority.

Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

### DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within  $\pm 375$  RPM and load is within  $\pm 10\%$  of when the fault occurred.

**NOTE:** It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

### Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

#### Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)

#### Trip on DRB III)

- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

#### Specific Good Trip

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

**Fuel System Good Trip**

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

**Misfire Good Trip**

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

**Warm-Up Cycles**

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

**Freeze Frame Data Storage**

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a

Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

**CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.**

**Similar Conditions Window**

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

**FUEL SYSTEM**

• **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

• **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

• **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

• **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

• **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

• **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

• **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

• **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

• **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the

## EMISSIONS CONTROL 4.0L/4.7L (Continued)

engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

**MISFIRE**

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

- **Misfire Data**— Data collected during test.

- **Test Done This Trip**— Indicates YES when the test is done.

## EVAPORATIVE EMISSIONS

### DESCRIPTION

#### DESCRIPTION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through the control valve, through the fuel management valve, and through vent hoses and tubes to a charcoal filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

Gas powered engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of

the evaporative system for OBD II requirements. Also refer to Leak Detection Pump.

Vehicles powered with gasoline engines are also equipped with ORVR (On-Board Refueling Vapor Recovery). Refer to ORVR for additional information.

**NOTE:** The evaporative system uses specially manufactured lines/hoses. If replacement becomes necessary, only use fuel resistant, low permeation hose.

Certain components can be found in (Fig. 1).

## EVAPORATIVE EMISSIONS (Continued)

## DESCRIPTION - CCV SYSTEM

The 4.0L 6-cylinder engine is equipped with a Crankcase Ventilation (CCV) system. The system consists of:

- A fixed orifice fitting of a calibrated size. This fitting is pressed into a rubber grommet located on the top/rear of cylinder head (valve) cover (Fig. 2).
- a pair of breather tubes (lines) to connect the system components.
- the air cleaner housing.
- an air inlet fitting (Fig. 2).

80b898f9

- 4 - INT. MAN. FITTING
- 5 - CCV BREATHER TUBE (FRONT)

## DESCRIPTION - PCV SYSTEM

The 4.7L V-8 engine is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

This system consists of:

- a PCV valve mounted to the oil filler housing (Fig. 3). The PCV valve is sealed to the oil filler housing with an o-ring.
- the air cleaner housing
- two interconnected breathers threaded into the rear of each cylinder head (Fig. 4).
- tubes and hose to connect the system components.

80b89905

- 4 - OIL FILLER TUBE
- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

## OPERATION

## OPERATION - 4.0L CCV SYSTEM

The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled PCV valve.

The fixed orifice fitting meters the amount of crankcase vapors drawn out of the engine.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Engine vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

## EVAPORATIVE EMISSIONS (Continued)

**Fig. 4 PCV System Hoses/Tubes—4.7L Engine**

- 1 - FRESH AIR FITTING
- 2 - CONNECTING TUBES/HOSES
- 3 - CRANKCASE BREATHERS (2)
- 4 - RUBBER HOSE
- 5 - AIR CLEANER RESONATOR

**OPERATION - 4.7L PCV SYSTEM**

The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose and crankcase breathers. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow-by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

**TYPICAL** PCV valves are shown in (Fig. 5), (Fig. 6) and (Fig. 7).

When the engine is not operating, or during an engine pop-back, the spring forces the plunger back against the seat (Fig. 5). This will prevent vapors from flowing through the valve.

**Fig. 5 Engine Off or Engine Pop-Back—No Vapor Flow**

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 6). In this position there is minimal vapor flow through the valve.

**Fig. 6 High Intake Manifold Vacuum—Minimal Vapor Flow**

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 7).

**Fig. 7 Moderate Intake Manifold Vacuum—Maximum Vapor Flow**

(1) Pull fixed orifice fitting (Fig. 8) from valve cover and leave tube attached.

(2) Start engine and bring to idle speed.

(3) If fitting is not plugged, a hissing noise will be heard as air passes through fitting orifice. Also, a strong vacuum should be felt with a finger placed at fitting inlet.

(4) If vacuum is not present, remove fitting orifice fitting from tube. Start engine. If vacuum can now be felt, replace fixed orifice fitting. Do not attempt to clean plastic fitting.

(5) If vacuum is still not felt at hose, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at intake manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

(6) Return fixed orifice fitting to valve cover and leave tube attached.

(7) Disconnect air inlet fitting and its attached hose at front of valve cover (Fig. 8). Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the rubber grommet (opening) of the disconnected air inlet fitting.

(8) The paper should be drawn against the rubber grommet with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(9) If vacuum is not present, check breather hoses/tubes/lines for obstructions or restrictions.

(10) After testing, reconnect all system hoses/tubes/lines.

## CCV HOSE (Continued)

### REMOVAL - FIXED ORIFICE FITTING

When installing fixed orifice fitting, be sure locations of fixed orifice fitting and air inlet fitting (Fig. 9) have not been inadvertently exchanged. The fixed orifice fitting is light grey in color and is located at **rear** of valve cover. The air inlet fitting is black in color and is located at **front** of valve cover.

80b898f9

**Fig. 9 FIXED ORIFICE FITTING - 4.0L**

- 3 - CCV BREATHER TUBE (REAR)
- 4 - INT. MAN. FITTING
- 5 - CCV BREATHER TUBE (FRONT)

(1) Pull fixed orifice fitting (Fig. 9) from valve cover grommet.

(2) Separate fitting from CCV breather tube.

### INSTALLATION - FIXED ORIFICE FITTING

When installing fixed orifice fitting, be sure locations of fixed orifice fitting and air inlet fitting (Fig. 9) have not been inadvertently exchanged. The fixed orifice fitting is light grey in color and is located at **rear** of valve cover. The air inlet fitting is black in color and is located at **front** of valve cover.

(1) Connect fitting to CCV breather tube.

(2) Return fixed orifice fitting to valve cover grommet.

## EVAP/PURGE SOLENOID

### DESCRIPTION

The duty cycle EVAP canister purge solenoid (DCP) regulates the rate of vapor flow from the EVAP can-

ister to the intake manifold. The Powertrain Control Module (PCM) operates the solenoid.

### OPERATION

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM cycles (energizes and de-energizes) the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time that the solenoid is energized. The PCM adjusts solenoid pulse width based on engine operating condition.

### REMOVAL

The duty cycle evaporative (EVAP) canister purge solenoid is located in the engine compartment near the brake master cylinder (Fig. 10).

(1) Disconnect electrical connector at solenoid.

(2) Disconnect vacuum lines at solenoid.

(3) Lift solenoid slot (Fig. 10) from mounting bracket for removal.

80d2abaa

**Fig. 10 EVAP/PURGE SOLENOID LOCATION**

- 2 - EVAP SOLENOID
- 3 - SLOT
- 4 - ELEC. CONNec.
- 5 - VACUUM LINE CONNec.
- 6 - TEST PORT

## EVAP/PURGE SOLENOID (Continued)

## INSTALLATION

- (1) Position solenoid slot to mounting bracket.
- (2) Connect vacuum lines to solenoid. Be sure vacuum lines are firmly connected and not leaking or damaged. If leaking, a Diagnostic Trouble Code (DTC) may be set with certain emission packages.
- (3) Connect electrical connector to solenoid.

## FUEL FILLER CAP

## DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

## OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

**CAUTION:** Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a California emissions package and a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

## REMOVAL

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

**CAUTION:** Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

## LEAK DETECTION PUMP

## DESCRIPTION

The evaporative emission system is designed to prevent the escape of fuel vapors from the fuel system (Fig. 11). Leaks in the system, even small ones, can allow fuel vapors to escape into the atmosphere. Government regulations require onboard testing to make sure that the evaporative (EVAP) system is functioning properly. The leak detection system tests for EVAP system leaks and blockage. It also performs

self-diagnostics. During self-diagnostics, the Powertrain Control Module (PCM) first checks the Leak Detection Pump (LDP) for electrical and mechanical faults. If the first checks pass, the PCM then uses the LDP to seal the vent valve and pump air into the system to pressurize it. If a leak is present, the PCM will continue pumping the LDP to replace the air that leaks out. The PCM determines the size of the leak based on how fast/long it must pump the LDP as it tries to maintain pressure in the system.

## EVAP LEAK DETECTION SYSTEM COMPONENTS

**Service Port:** Used with special tools like the Miller Evaporative Emissions Leak Detector (EELD) to test for leaks in the system.

**EVAP Purge Solenoid:** The PCM uses the EVAP purge solenoid to control purging of excess fuel vapors stored in the EVAP canister. It remains closed during leak testing to prevent loss of pressure.

**EVAP Canister:** The EVAP canister stores fuel vapors from the fuel tank for purging.

## LEAK DETECTION PUMP (Continued)

EVAP Purge Orifice: Limits purge volume.

EVAP System Air Filter: Provides air to the LDP for pressurizing the system. It filters out dirt while allowing a vent to atmosphere for the EVAP system.

## OPERATION

The main purpose of the LDP is to pressurize the fuel system for leak checking. It closes the EVAP system vent to atmospheric pressure so the system can be pressurized for leak testing. The diaphragm is powered by engine vacuum. It pumps air into the EVAP system to develop a pressure of about 7.5" H<sub>2</sub>O (1/4) psi. A reed switch in the LDP allows the PCM to monitor the position of the LDP diaphragm. The PCM uses the reed switch input to monitor how fast the LDP is pumping air into the EVAP system. This allows detection of leaks and blockage. The LDP assembly consists of several parts (Fig. 12). The solenoid is controlled by the PCM, and it connects the upper pump cavity to either engine vacuum or atmospheric pressure. A vent valve closes the EVAP system to atmosphere, sealing the system during leak testing. The pump section of the LDP consists of a diaphragm that moves up and down to bring air in through the air filter and inlet check valve, and

pump it out through an outlet check valve into the EVAP system. The diaphragm is pulled up by engine vacuum, and pushed down by spring pressure, as the LDP solenoid turns on and off. The LDP also has a magnetic reed switch to signal diaphragm position to the PCM. When the diaphragm is down, the switch is closed, which sends a 12 V (system voltage) signal to the PCM. When the diaphragm is up, the switch is open, and there is no voltage sent to the PCM. This allows the PCM to monitor LDP pumping action as it turns the LDP solenoid on and off.

## LDP AT REST (NOT POWERED)

When the LDP is at rest (no electrical/vacuum) the diaphragm is allowed to drop down if the internal (EVAP system) pressure is not greater than the return spring. The LDP solenoid blocks the engine vacuum port and opens the atmospheric pressure port connected through the EVAP system air filter. The vent valve is held open by the diaphragm. This allows the canister to see atmospheric pressure (Fig. 13).

- 7 - Engine Vacuum (Closed)

## DIAPHRAGM UPWARD MOVEMENT

When the PCM energizes the LDP solenoid, the solenoid blocks the atmospheric port leading through the EVAP air filter and at the same time opens the engine vacuum port to the pump cavity above the diaphragm. The diaphragm moves upward when vacuum above the diaphragm exceeds spring force. This

## LEAK DETECTION PUMP (Continued)

upward movement closes the vent valve. It also causes low pressure below the diaphragm, unseating the inlet check valve and allowing air in from the EVAP air filter. When the diaphragm completes its upward movement, the LDP reed switch turns from closed to open (Fig. 14).

80ce4017

**Fig. 14 DIAPHRAGM UPWARD MOVEMENT**

- 1 - Diaphragm
- 2 - Inlet Check Valve (Open)
- 3 - Vent Valve (Closed)
- 4 - From Air Filter
- 5 - To Canister
- 6 - Outlet Check Valve (Closed)
- 7 - Engine Vacuum (Open)

**DIAPHRAGM DOWNWARD MOVEMENT**

Based on reed switch input, the PCM de-energizes the LDP solenoid, causing it to block the vacuum port, and open the atmospheric port. This connects the upper pump cavity to atmosphere through the EVAP air filter. The spring is now able to push the diaphragm down. The downward movement of the diaphragm closes the inlet check valve and opens the outlet check valve pumping air into the evaporative system. The LDP reed switch turns from open to closed, allowing the PCM to monitor LDP pumping (diaphragm up/down) activity (Fig. 15). During the pumping mode, the diaphragm will not move down far enough to open the vent valve. The pumping cycle is repeated as the solenoid is turned on and off. When the evaporative system begins to pressurize, the pressure on the bottom of the diaphragm will begin to oppose the spring pressure, slowing the pumping action. The PCM watches the time from when the solenoid is de-energized, until the dia-

phragm drops down far enough for the reed switch to change from opened to closed. If the reed switch changes too quickly, a leak may be indicated. The longer it takes the reed switch to change state, the tighter the evaporative system is sealed. If the system pressurizes too quickly, a restriction somewhere in the EVAP system may be indicated.

80ce401c

**Fig. 15 DIAPHRAGM DOWNWARD MOVEMENT**

- 2 - Inlet Check Valve (Closed)
- 3 - Vent Valve (Closed)
- 4 - From Air Filter
- 5 - To Canister
- 6 - Outlet Check Valve (Open)
- 7 - Engine Vacuum (Closed)

**PUMPING ACTION**

**Action :** During portions of this test, the PCM uses the reed switch to monitor diaphragm movement. The solenoid is only turned on by the PCM after the reed switch changes from open to closed, indicating that the diaphragm has moved down. At other times during the test, the PCM will rapidly cycle the LDP solenoid on and off to quickly pressurize the system. During rapid cycling, the diaphragm will not move enough to change the reed switch state. In the state of rapid cycling, the PCM will use a fixed time interval to cycle the solenoid. If the system does not pass the EVAP Leak Detection Test, the following DTCs may be set:

- P0442 - EVAP LEAK MONITOR 0.040" LEAK DETECTED
- P0455 - EVAP LEAK MONITOR LARGE LEAK DETECTED

## LEAK DETECTION PUMP (Continued)

- P0456 - EVAP LEAK MONITOR 0.020" LEAK DETECTED

- P1495 - LEAK DETECTION PUMP SOLENOID CIRCUIT

## DIAGNOSIS AND TESTING - ENABLING CONDITIONS TO RUN EVAP LEAK DETECTION TEST

- Cold start: with ambient temperature (obtained from modeling the inlet air temperature sensor on passenger vehicles and the battery temperature sensor on Jeep & Dodge Truck vehicles) between 4° C (40° F) and 32° C (90° F) for 0.040 leak. Between 4° C (40° F) and 29° C (85° F) for 0.020 leak.
- Engine coolant temperature within:-12° to -8° C (10° to 18° F) of battery/ambient.
- Battery voltage between 10 and 15 volts.
- Low fuel warning light off (fuel level must be between 15% and 85%).
- MAP sensor reading 22 in Hg or above (This is the manifold absolute pressure, not vacuum).
- No engine stall during test.

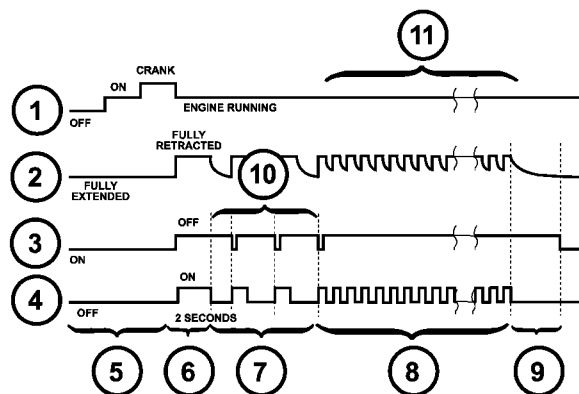

**NOTE: IF BATTERY VOLTAGE DROPS BELOW 10 VOLTS FOR MORE THAN 5 SECONDS DURING ENGINE CRANKING, THE EVAP LEAK DETECTION TEST WILL NOT RUN.**

**NOTE: THE FOLLOWING VALUES ARE APPROXIMATE AND VEHICLE SPECIFIC. USE THE VALUES SEEN IN PRE TEST/MONITOR TEST SCREEN ON THE DRB III®. SEE TSB 25-02-98 FOR MORE DETAIL.**

A DTC will not be set if a one-trip fault is set or if the MIL is illuminated for any of the following:

- Purge Solenoid Electrical Fault
- All TPS Faults
- All Engine Controller Self Test Faults
- LDP Pressure Switch Fault
- All Cam and/or Crank Sensor Fault
- EGR Solenoid Electrical Fault
- All MAP Sensor Faults
- All Injector Faults
- Ambient/Battery Temperature Sensor Electrical Faults
- Baro Out of Range
- Vehicle Speed Faults
- All Coolant Sensor Faults
- LDP Solenoid Circuit

- 9 - SECTION 5
- 10 - 3 TEST CYCLES TO TEST FOR BLOCKAGE
- 11 - RAPID PUMP CYCLING FOR 70 CYCLES

**NOTE: IF BATTERY TEMPERATURE IS NOT WITHIN RANGE, OR IF THE ENGINE COOLANT TEMPERATURE IS NOT WITHIN A SPECIFIED RANGE OF THE BATTERY TEMPERATURE, THE PCM WILL NOT RUN TESTS FOR DTC P1494, P1486, P0442, P0455 AND P0441. THESE TEMPERATURE CALIBRATIONS MAY BE DIFFERENT BETWEEN MODELS.**

**SECTION 1 - P1495 Leak Detection Pump Solenoid Circuit-** When the ignition key is turned to "ON", the LDP diaphragm should be in the down position and the LDP reed switch should be closed. If the EVAP system has residual pressure, the LDP diaphragm may be up. This could result in the LDP reed switch being open when the key is turned to "ON" and a P1494 fault could be set because the PCM is expecting the reed switch to be closed.

After the key is turned "ON", the PCM immediately tests the LDP solenoid circuit for electrical faults. If a fault is detected, DTC P1495 will set, the MIL will illuminate, and the remaining EVAP Leak Detection Test is canceled.

**SECTION 2 - P1494 Leak Detection Pump Switch or Mechanical Fault-** If DTC P1495 is not set, the PCM will check for DTC P1494. If the LDP reed switch was closed when the key was turned to "ON", the PCM energizes the LDP solenoid for up to

## LEAK DETECTION PUMP (Continued)

8 seconds and monitors the LDP switch. As the LDP diaphragm is pulled up by engine vacuum, the LDP reed switch should change from closed to open. If it does not, the PCM sets a temporary fault (P1494) in memory, and waits until the next time the Enabling Conditions are met to run the test again. If this is again detected, P1494 is stored and the MIL is illuminated. If the problem is not detected during the next enabling cycle, the temporary fault will be cleared.

However, if the PCM detects the reed switch open when the key is turned to "ON", the PCM must determine if this condition is due to residual pressure in the EVAP system, or an actual fault. The PCM stores information in memory on EVAP system purging from previous engine run or drive cycles.

If little or no purging took place, residual pressure could be holding the LDP diaphragm up, causing the LDP switch to be open. Since this is not a malfunction, the PCM cancels the EVAP Leak Detection Test without setting the temporary fault.

If there was sufficient purging during the previous cycle to eliminate EVAP system pressure, the PCM judges that this is a malfunction and sets a temporary fault in memory. The next time that the Enabling Conditions are met, the test will run again. If the fault is again detected, the MIL will illuminate and DTC P1494 will be stored. If the fault is not detected, the temporary fault will be cleared.

**SECTION 3 - P1486 EVAP Leak Monitor Pinched Hose Found-** If no fault has been detected so far, the PCM begins testing for possible blockage in the EVAP system between the LDP and the fuel tank. This is done by monitoring the time required for the LDP to pump air into the EVAP system during two to three pump cycles. If no blockage is present, the LDP diaphragm is able to quickly pump air out of the LDP each time the PCM turns off the LDP solenoid. If a blockage is present, the PCM detects that the LDP takes longer to complete each pump cycle. If the pump cycles take longer than expected (approximately 6 to 10 seconds) the PCM will suspect a blockage. On the next drive when Enabling Conditions are met, the test will run again. If blockage is again detected, P1486 is stored, and the MIL is illuminated.

**SECTION 4 - No DTC Can Be Set During This Time-** After the LDP blockage tests are completed, the PCM then tests for EVAP system leakage. First, the PCM commands the LDP to rapidly pump for 20 to 50 seconds (depending on fuel level) to build pressure in the EVAP system. This evaluates the system J18-24-0 to see if it can be sufficiently pressurized. This evaluation (rapid pump cycling) may occur several times prior to leak checking. The LDP reed switch does not close and open during rapid pumping

because the diaphragm does not travel through its full range during this part of the test.

**SECTION 5 - P0456, P0442, P0455 EVAP Leak Monitor and Leak Detected-** Next, the PCM performs one or more test cycles by monitoring the time required for the LDP reed switch to close (diaphragm to drop) after the LDP solenoid is turned off.

If the switch does not close, or closes after a long delay, it means that the system does not have any significant leakage and the EVAP Leak Detection Test is complete.

However, if the LDP reed switch closes quickly, there may be a leak or the fuel level may be low enough that the LDP must pump more to finish pressurizing the EVAP system. In this case, the PCM will rapidly pump the LDP again to build pressure in the EVAP system, and follow that by monitoring the time needed for several LDP test cycles. This process of rapid pumping followed by several LDP test cycles may repeat several times before the PCM judges that a leak is present.

When leaks are present, the LDP test cycle time will be inversely proportional to the size of the leak. The larger the leak, the shorter the test cycle time. The smaller the leak, the longer the test cycle time. DTC's may be set when a leak as small as 0.5 mm (0.020") diameter is present.

If the system detects a leak, a temporary fault will be stored in PCM memory. The time it takes to detect a .020, .040, or Large leak is based on calibrations that vary from model to model. The important point to remember is if a leak is again detected on the next EVAP Leak Detection Test, the MIL will illuminate and a DTC will be stored based on the size of leak detected. If no leak is detected during the next test, the temporary fault will be cleared.

**DIAGNOSTIC TIPS** During diagnosis, you can compare the LDP solenoid activity with the monitor sequence in Figure 6. If the PCM detects a problem that could set a DTC, the testing is halted and LDP solenoid activity will stop. As each section of the test begins, it indicates that the previous section passed successfully. By watching to see which tests complete, you can see if any conditions are present that the PCM considers abnormal.

For example, if the LDP solenoid is energized for the test cycles to test for blockage (P1486), it means that the LDP has already passed its test for P1494. Then, if the PCM detects a possible blockage, it will set a temporary fault without turning on the MIL and continue the leak portion of the test. However, the PCM will assume that the system is already pressurized and skip the rapid pump cycles.

Always diagnose leaks, if possible, before disconnecting connections. Disconnecting connections may mask a leak condition.

## LEAK DETECTION PUMP (Continued)

Keep in mind that if the purge solenoid seat is leaking, it could go undetected since the leak would end up in the intake manifold. Disconnect the purge solenoid at the manifold when leak checking. In addition, a pinched hose fault (P1486) could set if the purge solenoid does not purge the fuel system properly (blocked seat). The purge solenoid must vent the fuel system prior to the LDP system test. If the purge solenoid cannot properly vent the system the LDP cannot properly complete the test for P1486 and this fault can set due to pressure being in the EVAP system during the test sequence.

Multiple actuation's of the DRB III® Leak Detection Pump (LDP) Monitor Test can hide a 0.020 leak because of excess vapor generation. Additionally, any source for additional vapor generation can hide a small leak in the EVAP system. Excess vapor generation can delay the fall of the LDP diaphragm thus hiding the small leak. An example of this condition could be bringing a cold vehicle into a warm shop for testing or high ambient temperatures.

Fully plugged and partially plugged underhood vacuum lines have been known to set MIL conditions. P1494 and P0456 can be set for this reason. Always, thoroughly, check plumbing for pinches or blockage before condemning components.

**TEST EQUIPMENT** The Evaporative Emission Leak Detector (EELD) Miller Special Tool 8404 is capable of visually detecting leaks in the evaporative system and will take the place of the ultrasonic leak detector 6917A. The EELD utilizes shop air and a smoke generator to visually detect leaks down to 0.020 or smaller. The food grade oil used to make the smoke includes an UV trace dye that will leave tell-tale signs of the leak under a black light. This is helpful when components have to be removed to determine the exact leak location. For detailed test instructions, follow the operators manual packaged with the EELD.

**NOTE:** Be sure that the PCM has the latest software update. Reprogram as indicated by any applicable Technical Service Bulletin. After LDP repairs are completed, verify the repair by running the DRB III® Leak Detection Pump (LDP) Monitor Test as described in Technical Service Bulletin 18-12-99.

## REMOVAL

The Leak Detection Pump (LDP) is located under the left quarter panel behind the left/rear wheel (Fig. 16). It is attached to a two-piece support bracket (Fig. 17). The LDP and LDP filter are replaced (serviced) as one unit.

- (1) Remove stone shield behind left/rear wheel (Fig. 18). Drill out plastic rivets for removal.
- (2) Remove 3 LDP mounting bolts (Fig. 19).

- (3) Remove support bracket brace bolt (Fig. 17).
- (4) Loosen, but do not remove 2 support bracket nuts at frame rail (Fig. 19).
- (5) To separate and lower front section of two-piece support bracket, remove 3 attaching bolts on bottom of support bracket (Fig. 17). While lowering support bracket, disconnect LDP wiring clip (Fig. 20).
- (6) Disconnect electrical connector at LDP (Fig. 20).
- (7) Carefully remove vapor/vacuum lines at LDP (Fig. 20).
- (8) Remove LDP.

80d63c7a

**Fig. 16 LOCATION, LDP / EVAP CANISTER**

## INSTALLATION

The LDP is located in the left quarter panel behind the left/rear wheel. It is attached to a two-piece support bracket (Fig. 17). The LDP and LDP filter are replaced (serviced) as one unit.

(1) Position LDP and carefully install vapor/vacuum lines to LDP and LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

- (2) Connect electrical connector to LDP.
- (3) While raising front section of support bracket, connect LDP wiring clip (Fig. 20).
- (4) Install 3 LDP mounting bolts (Fig. 19). Refer to Torque Specifications.

## LEAK DETECTION PUMP (Continued)

(5) Join front and rear sections of two-piece support bracket by installing 3 bolts on bottom of support bracket (Fig. 17). Do not tighten bolts at this time.

(6) Install support bracket brace bolt (Fig. 17). Do not tighten bolt at this time.

(7) Tighten 2 support bracket nuts at frame rail (Fig. 19). Refer to Torque Specifications.

(8) Tighten 3 support bracket bolts and brace bolt. Refer to Torque Specifications.

(9) Position stone shield behind left/rear wheel (Fig. 18). Install new plastic rivets.

## ORVR

## DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister. Certain ORVR components can be found in (Fig. 1).

## OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled. Certain ORVR components can be found in (Fig. 1).

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spitting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

## PCV VALVE

## DIAGNOSIS AND TESTING - PCV VALVE/PCV SYSTEM - 4.7L

(1) Disconnect PCV line/hose (Fig. 21) by disconnecting rubber connecting hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs have been freed at cam lock (Fig. 21). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 21). Also, PCV valve should rattle when shaken.

(4) Reconnect PCV valve to its connecting line/hose.

(5) Start engine and bring to idle speed.

(6) If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.

(7) If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

(8) **Do not attempt to clean the old PCV valve.**

(9) Return PCV valve back to oil filler tube by placing valve locating tabs (Fig. 21) into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(10) Connect PCV line/hose and connecting rubber hose to PCV valve.

(11) Disconnect rubber hose from fresh air fitting at left side of air cleaner resonator box (Fig. 22). Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.

(12) The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

## PCV VALVE (Continued)

(13) If vacuum is not present, disconnect each PCV system hose at top of each breather (Fig. 22). Check for obstructions or restrictions.

(14) If vacuum is still not present, remove each PCV system breather (Fig. 22) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather

(15) If vacuum is still not present, disconnect each PCV system hose at each fitting and check for obstructions or restrictions.

- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

## PCV VALVE (Continued)

## REMOVAL - PCV VALVE - 4.7L

The PCV valve is located on the oil filler tube (Fig. 23). Two locating tabs are located on the side of the valve (Fig. 23). These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

**Fig. 23 PCV Valve/Oil Filler Tube Location**

- 1 - O-RING
- 2 - LOCATING TABS
- 3 - CAM LOCK
- 4 - OIL FILLER TUBE
- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

(1) Disconnect PCV line/hose (Fig. 23) by disconnecting rubber hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward (counter-clockwise) until locating tabs have been freed at cam lock (Fig. 23). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 23).

## INSTALLATION - PCV VALVE - 4.7L

The PCV valve is located on the oil filler tube (Fig. 23). Two locating tabs are located on the side of the valve (Fig. 23). These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

(1) Return PCV valve back to oil filler tube by placing valve locating tabs (Fig. 23) into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(2) Connect PCV line/hose and rubber hose to PCV valve.

## VACUUM LINES

## DESCRIPTION

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

## VAPOR CANISTER

## DESCRIPTION

A maintenance free, EVAP canister is used on all gasoline powered models. The canister is attached to a two-piece support bracket located behind the left-rear wheel.

## OPERATION

The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

The canister serves two functions: as a temporary fuel vapor storage point while refueling the vehicle for the ORVR system, as a temporary vapor storage point while the engine is running.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

Refer to ORVR for additional information.

## REMOVAL

The EVAP canister is located behind the left-rear wheel (Fig. 24). It is attached to a two-piece support bracket (Fig. 25).

(1) **Equipped With Rear Tow Hooks:** Remove tow hook support bar (2 bolts). This bar is located near the upper / rear support bracket bolt (#2) (Fig. 27).

## VAPOR CANISTER (Continued)

- (2) Remove 1 support bracket brace bolt (Fig. 25).
- (3) Loosen, but do not remove 2 support bracket nuts (Fig. 26).
- (4) Remove upper/rear support bracket mounting bolt (Fig. 27).
- (5) Carefully lower support bracket assembly to gain access to vapor / vacuum lines. To prevent damage to lines, suspend bracket assembly with rope or string.
- (6) Disconnect necessary vacuum / vapor lines at EVAP canister.
- (7) Remove EVAP canister mounting bolt (Fig. 28).
- (8) Lift canister from support bracket (2 pins are used to align canister into support bracket)

80d63c7a

**Fig. 24 LOCATION, LDP / EVAP CANISTER**

- 1 - LEAK DETECTION PUMP
- 2 - EVAP CANISTER

**INSTALLATION**

The EVAP canister is located behind the left-rear wheel (Fig. 24). It is attached to a two-piece support bracket (Fig. 25).

- (1) Position canister to support bracket. Guide 2 alignment pins into support bracket.
- (2) Install EVAP canister mounting bolt (Fig. 28). Refer to Torque Specifications.
- (3) Carefully install vapor / vacuum lines to canister. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
